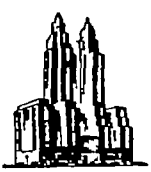
Lutatio Cum Luto



By DAGMAR

After one has visited in Pistany Spa in Czechoslovakia, one may learn to visualize the surprise the Romans must have experienced when they extended their empire to the North in the 9th century They knew that it was a phenomena they had conquered, this spot, where the earth extravagated hot mud, where springs disembogued sulphurous hot water But they were unable to realize that this place would become in later years the Mecca of an untold number of suffering, health-seeking mortals Legend has it that a young Roman general, fatigued from the long march had collapsed on the very spot after the word "halt" had been given and that when he found himself lying in the warm mud, he had the peculiar sensation of regaining his strength and his energy in double a measure and that he then had issued the order LUTATIO CUM LUTO, his legionnaires too should benefit by the mud bath, vigorous, invincible men he needed However, chronicles of the year 1551 were the first ones to record Pistany's official praise It was Count Sigismund von Herberstein, an explorer, who wrote an incandescent account of 'his discovery" even though it is an established fact, passed on by word of mouth, that the place was known for its healing qualities throughout the centuries Dr Johan Grato von Kraftsheim, the much appreciated medical adviser of three reigning emperors, prescribed a forty days cure at Pistany to his royal patients in 1580

Unfortunately, the wars with the Turks and the "Thirty Years War" as also the caprices of the river Waag which changed its course several times, prevented Pistany to take its proper place among the world's famous spas sooner It was not until the 19th century that its fame began to spread over the globe Today it is recognized by the medical profession

as a potent help in the cure of many diseases. Here may those, who are afflicted with any of the rheumatic ailments, such as arthritis, neuralgia, neuritis, sciatica, women and skin diseases, asthma and other illnesses be generally cured or find great relief amidst fastidious surroundings, situated in a setting of natural beauty

The radio-active volcanic mud has a temperature up to 140° F and the sulphurous thermal springs reach a temperature of 153° F The thermal springs gush out from unknown depths and pass through the subterranean basin of sandstone of the Miocene period that is the tertiary system of strata, following the cretaceous system of geologic times They then penetrate the loose alluvium which floats down the river Waag from which they force out the cold, lower water By contact with the cold water, highly radio-active thermal mud is deposited This writer was told that the area of the subterranean basin is estimated at more than 10,000 square yards In cures, the hot thermal water is blended with cold thermal water thus attaining the various temperatures required by the patients according to the physician's analysis The chemical consistency of the mud reveals the presence of calcium, silica, iron, and aluminum oxides in large proportions as well as sulphur containing bacterial flora. Science considers this combination

WHEN A FAMILY MUST ECONOMIZE ON FUNERAL COSTS

Overwhelming sentiment sometimes tempts a bereaved family to provide a funeral costing more than they can well afford The family physician can often appropriately render such people a good service by suggesting that they first inquire into Campbell service and prices Our policy is never to "oversell" our patrons Caskets as low as $75 — and many of the funerals we conduct cost less than $200 complete

FRANK E. CAMPBELL

THE FUNERAL CHURCH, Inc.

BROADWAY AT 66th STREET *PHONE* TRafalgar 7-8200

fected after a twenty days treatment on my friend the beautiful, petite, blonde Hollywood actress While she obeyed religiously the orders of her physician, I had sojourned through the adjacent country where the natives wear their costumes, elaborate affairs stitched all over in gold and silver, so much more frequently than in any other part of the country, I thought. When I had left, my friend was using one of the rickshaws, a little house with a roof on wheels manned by foot by a peasant boy or girl, which transfers patients from their hotels to the bath When I returned, she hooked her arm affectionately in mine and walked across the bridge to the bath with a radiant smile on her face. She even insisted on having tea with me on the top of Radium Hill on which the exquisite pagoda-like tea house is erected and from the balconies of which one obtains such sweeping view of the town and the valley of the Waag

One institute I had no time to visit while I was at Pistany and that is the Animal Institute. Being a lover of pets of all sorts, I regretted my inability very much However, I made up for my loss by reading the interesting article "Animals Come to Pistany" by Dr R L Stuerm which appeared in one of the leading magazines not so long ago

Soon again I shall stand in the large entrance hall of the Thermia Palace Hotel and look admiringly at the painting of Alfons Mucha, showing his convalescent daughter who regained her health at Pistany A sturdy peasant girl offers her flowers, grown under a moderate sun, while the burning rays of ancient suns are responsible for the magic warmth that have produced the curative mud and water Under the picture are written words, which necessarily must have an emotional appeal

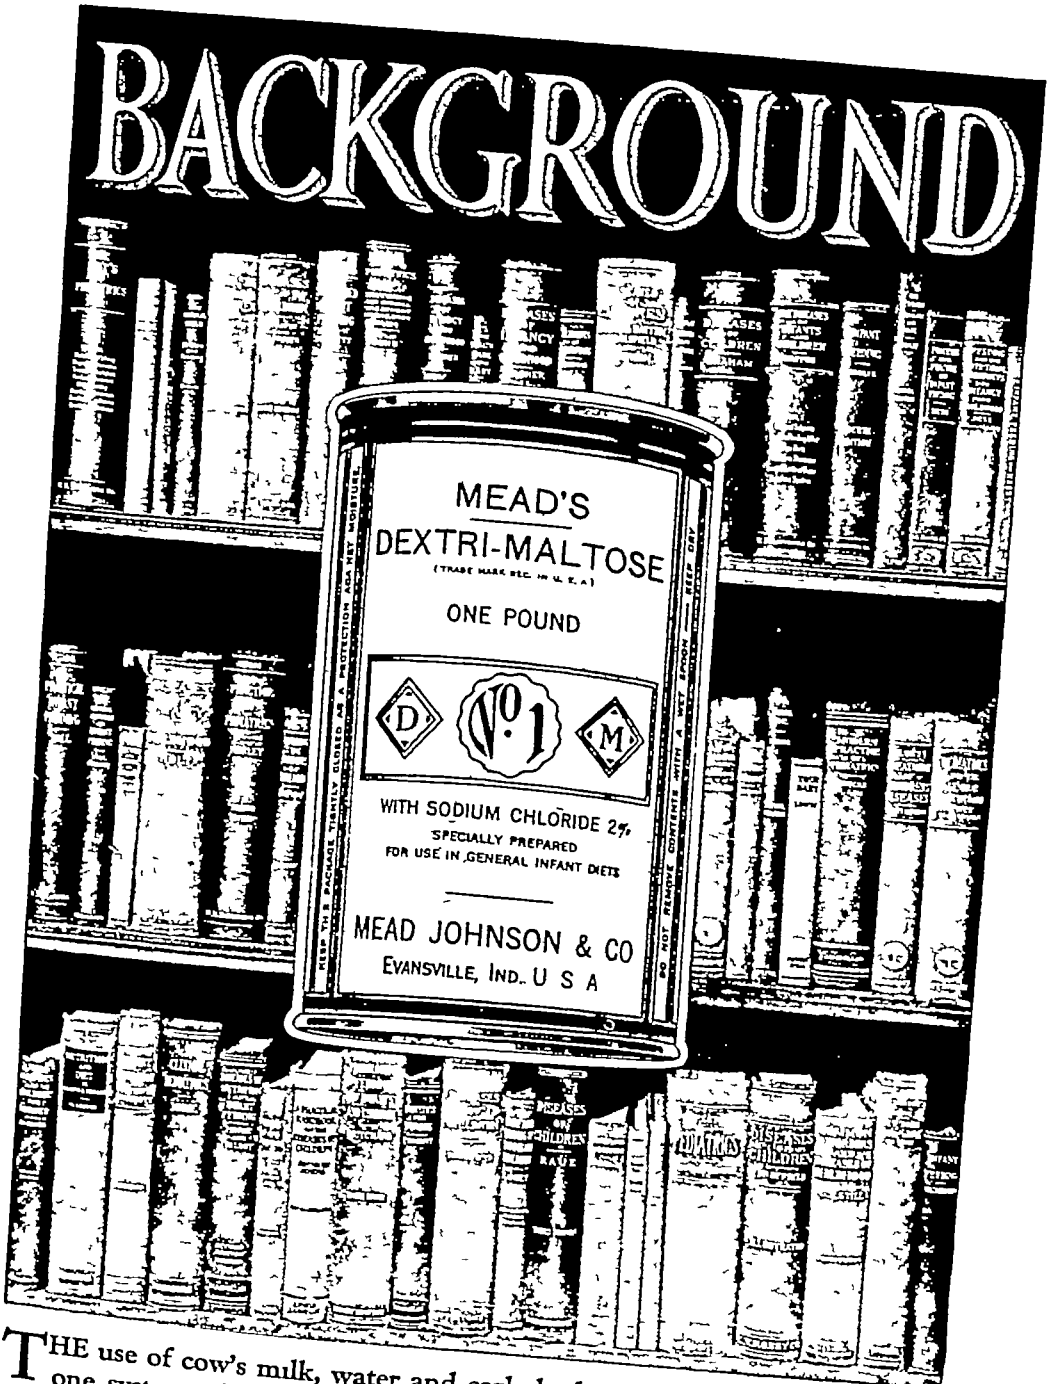
PABLUM Absorbs 7 Times Its Weight in MILK!

RICH IN IRON AND VITAMIN B, PABLUM COMPLEMENTS MILK

PABLUM is a distinct aid in the ever-present problem of persuading children to take more milk. So porous is Pablum that when mixed to the consistency of ordinary hot cooked cereals it holds 7 times its weight in milk—before being served with added milk and sugar Pablum is not only an excellent carrier for the high food values which make milk indispensable in the child s diet, but in addition Pablum complements milk. The latter, although regarded as a nearly perfect food, is recognized as being deficient in iron and in vitamin B, both highly essential to the growing child These deficiencies are corrected when milk is combined with Pablum, the latter furnishing 8½ mg iron per ounce and an important amount of vitamin B An average portion of Pablum (1 ounce) as served at the table with milk and sugar offers unusually high nutritional values, namely



Ca	P	Fe	Vitamins A, B, G	Protein	Fat	Carbohydrates	Calories
53 gm	41 gm	9 mg	+ + +	13 gm	10 gm	39 gm	295

The calcium and iron—minerals often deficient in the child s diet—generously aid in meeting the daily requirements Substantial amounts of phosphorus and vitamins B and G are also furnished In addition, there is a large measure of protein, fat, carbohydrates, and calories That Pablum is more than a breakfast dish is being recognized by physicians who use it not only in infant and child feeding but also recommend Pablum to adults

Pablum consists of wheatmeal (farina) oatmeal cornmeal wheat embryo brewers' yeast alfalfa leaf beef bone reduced iron and sodium chloride.

BUFFERED ALKALINIZATION

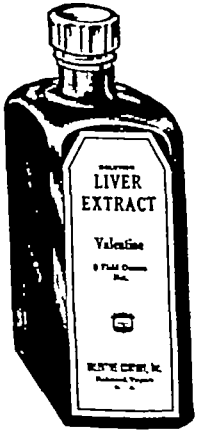
by the safe, physiological process

WHERE buffered alkalinization is desirable—as during sulfanilamide administration, in the treatment of colds, influenza and other seasonal respiratory affections—Kalak offers these clinical advantages

(1) It presents a balanced combination of bicarbonates in solution (2) It contains the mineral substances normal to the blood (and no other)

Kalak's high buffering value helps to maintain the urinary pH of 7 4 which has been found so desirable in sulfanilamide therapy

KALAK



is synthetically prepared—is hypertonic, uniform in composition, definite in alkali potency

KALAK WATER COMPANY OF NEW YORK, INC., 6 CHURCH STREET, NEW YORK CITY

An aqueous liver extract of proved potency and economy.

Effective in pernicious anemia, sprue and the anemia of pregnancy.

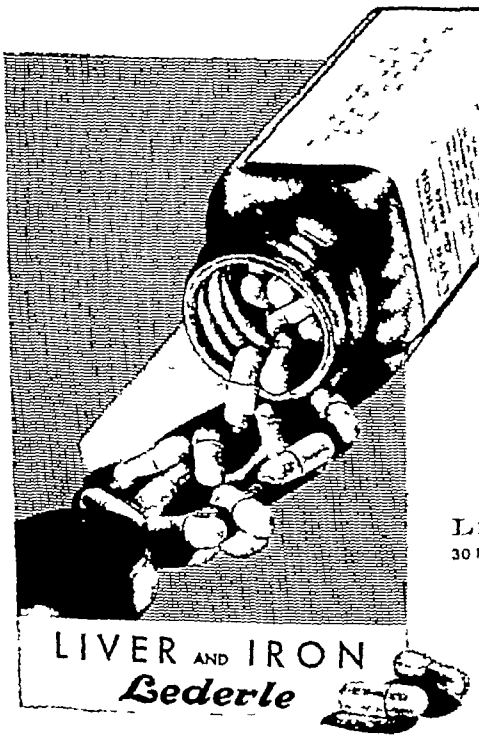
In nutritional and
other hypochromic anemias—

LIVER AND IRON

(CAPSULES)



Lederle

HEMOGLOBIN REGENERATION is the therapeutic problem in the treatment of the large group of secondary or hypochromic anemias These include posthemorragic anemias, "idiopathic" hypochromic anemia, nutritional anemias, anemia secondary to infection parasitic infestation and intoxications and hypochromic anemia of pregnancy Effective therapy of the last-named condition, moreover, serves as the preferred prophylactic treatment of anemia of infancy

The present trend of opinion suggests that only ferrous iron, or iron which is reduced in the body to an ionizable ferrous salt, is useful in hemoglobin production

"Liver and Iron *Lederle*" is prepared to meet the demand caused by this change in opinion and in addition to total water soluble extractives of whole liver contains effective amounts of readily assimilable ferrous sulfate

Available in bottles containing 40, 100 and 500 capsules

VEGEX
for
B VITAMINS

B VITAMIN COMPLEX

1 2 3 4 5 6 7 8 9

NINE (NELSON) FACTORS

Inter-related – Inter-dependent

There are—Nelson—nine separate factors in the B vitamin Complex Take B_1, G, or other factors out and growth stops Put it back, along with the rest of the nine, and growth comes back

This does not mean that growth can be claimed for just one factor, away from the rest of the nine Such claims are projecting an error in medicine, already are launching another proprietary vitamin racket.

Any biological chemist would not think of getting a strong litter, or any litter from the stock animals with but a part of the B Complex He or she knows that the disorder caused by a deficiency in one factor must have the whole complex to fully relieve it, otherwise the animal dies

To Be Sure

The physician selecting B_1 for antineuritic use will do well to have that B_1 along with enough of G and the others So, too, if the particular function of G is desired, B_1 and the others are needed

The Committee on nomenclature of the American Society of Biological Chemists recommended, 1927, that

> the term G be used to denote the more heat stable water soluble dietary factor called the P P (pellagra preventive) factor by Goldberger and associates and which also has to do with maintenance and growth

The Sherman-Bourquin test, under which G came into so much of labeling and advertising, proves, now, to have been finding only the riboflavine factor G , in the South, means the P-P factor Human life is too all important to accede to the suggestion, all right, just call riboflavine, G.

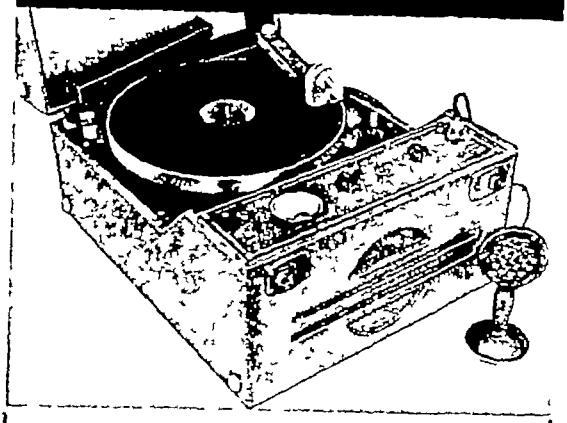
Vitamin B Complex Complete

Vegex furnishes the complete, potent, palatable and easily borne food vitamin B Complex It is high, 05% in 100% available iron

Some thirty years ago, it was discovered that the autolyzed yeast proteins taste like meat. From use in world famed soups, Vegex, when vitamin B was discovered, was selected for mass anti-beriberi use during the World War In the South and in most other pellagra sections of the world. Vegex has proven high in G, P-P (pellagra-preventive) factor

In the pioneer research which showed the relation of the B vitamins in child growth, normal lactation, their aid in some gastro-intestinal and related disorders, Vegex was used.

So, too, Strauss, and then Jolliffe and associates, used Vegex in showing the relation of and need for the B vitamin Complex in treating alcoholic polyneuritis, where B_1, alone, is not all sufficient.



Sample sent only on request

The extrinsic factor has been established for Vegex, another story for next month s Vegex page

PRESTO
SOUND RECORDING EQUIPMENT

WHEN you want to make individual phonograph records of certain sounds to be used in cases of defective hearing . or, if you want to record a running comment to be reproduced with motion pictures or slide films use the

PRESTO PORTABLE SOUND RECORDER

Presto recorders make phonograph records of any audible sound They give a quality of reproduction equal to any commercial record The records may be played as soon as they are recorded . no processing is required The records are durable, have a life of 100 playings or more using ordinary steel needles

No technical skill is needed to make Presto records. Simply follow brief instructions furnished with the instrument.

The model illustrated sells at $149 00 Other models are available at $325 00 and up For further information, write

A TRUE IODIZED OIL

LIPIODOL (LAFAY)* IN DIAGNOSTIC RADIOLOGY

Lipiodol is not a chloro-iodized oil—it contains no chlorine. Chemical titration is not necessary to detect deterioration as is the case with chloro-iodized oils

These, briefly, are the eight essential features of Lipiodol (Lafay)

1 The original French iodized oil
2 Not a chloro-iodized oil
3 Light amber color — helps detect deterioration
4 Bland and well tolerated even by delicate tissues
5 Relatively non-irritating and non-toxic
6 Precise, clear cut, sharply outlined radiographs
7 Facilitates diagnosis of many obscure conditions
8 Reveals pathologic conditions which ordinary radiographs cannot visualize

**Iodized Poppy-Seed Oil 40%*

Please send for booklet "Lipiodol in Radiologic Diagnosis"

LIPIODOL (LAFAY)

Why Minerals in Your Vitamin Prescriptions?

THE close association in which vitamins and minerals are invariably found in Nature is highly significant! For when Dr Casimir Funk and Dr H. E Dubin, pioneer authorities in vitamin therapy, first revealed the cooperative interdependence existing between these essential elements, they uncovered a fact of startling therapeutic importance. Let's examine the evidence

From the laboratory: Dr. Walter H Eddy of Columbia University tested the efficacy of A-D and A-B-D-G preparations as against that of a comprehensive vitamin-*mineral* concentrate (Vi-Syneral) His results showed that rats fed *minerals* with multiple vitamins enjoyed a *measurably greater stimulation* in growth "Correlated with better growth," he adds, "was better physical condition of the test animals"

From the clinician. Dr Anthony T. Privatera tested 100 school children—part on a diet supplemented with cod liver oil, part on the same diet, but with a vitamin-*mineral* supplement (Vi-Syneral) Those receiving multiple vitamins *with* minerals over a six-months' period achieved a superior increase in weight, accompanied by a greater freedom from dental caries

From the practicing physician: To reproduce all the reports from physicians would require a book One Pennsylvania physician typically writes: "I think Vi-Syneral is the best balanced preparation on the market, and find therefore that it gives better results"

Vi-Syneral supplies all the definitely recognized vitamins fortified *with eight essential minerals*—in standardized potencies for each age group The preponderance of evidence endorses its prescription as a protective diet supplement, and as an adjuvant to other treatment, for the achievement of optimum good health.

Write for complete literature and clinical samples.

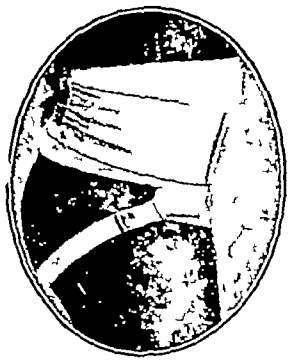
TREATMENT OF BRONCHIAL ASTHMA BY ORAL INHALATION

ADRENALIN CHLORIDE SOLUTION 1:100

THE oral inhalation of Adrenalin Chloride Solution 1:100 is promptly effective in relieving symptoms of bronchial asthma—in most cases results have been quite as satisfactory as those following hypodermic injection of the familiar 1:1000 solution. Nervousness and tachycardia, as well as other reactions which often accompany parenteral administration, are much less frequent following inhalation therapy. Discomfort and inconvenience of hypodermic injection are obviated by this new treatment



Adrenalin is the Parke-Davis brand of Epinephrine U S P Adrenalin Chloride Solution 1:100 is accepted by the Council on Pharmacy and Chemistry of the American Medical Association; it is supplied in 5-cc. vials, together with dropper for transferring the solution to a suitable atomizer, vaporizer, or nebulizer The apparatus used must deliver a fine spray entirely free from drops

How the Deaf Hear with CORONATION ACOUSTICON

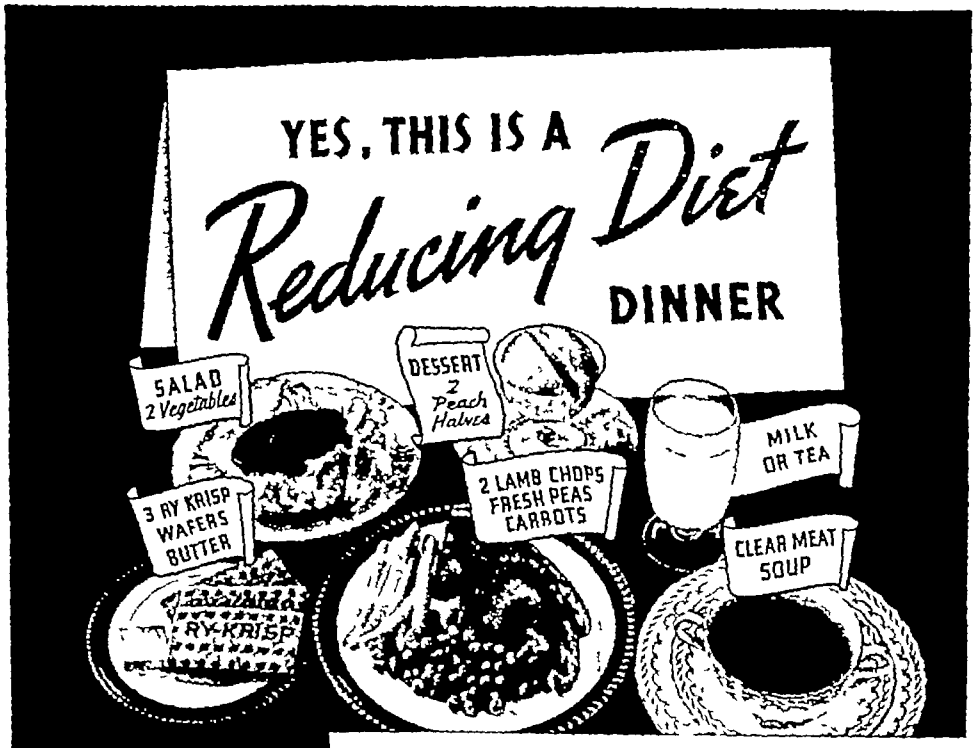
This diagram of the ear will help you explain both bone conduction and air conduction to your patients Interestingly colored it will look very attractive on the wall of your office We will be glad to send one of these diagrams to you free upon request so that you may easily explain how your patients can hear with a Coronation Acousticon

• A CROWNING ACHIEVEMENT IN THE HEARING AID FIELD, the Coronation Acousticon is notable for its tone-controlling variants and the clarity with which it reproduces both brilliant and mellow sounds Its unusual flexibility makes it more than ever adaptable to individual hearing requirements

• SEND YOUR PATIENTS TO YOUR LOCAL ACOUSTICON INSTITUTE for custom fittings on the Aurogange and Acoustiscope, the instruments by which Acousticons are fitted with scientific accuracy If you prefer, fittings will be made at your office or in your patients' homes There is no charge or obligation for this service

• HAVE YOU ANY PATIENTS WHO SHOULD BE WEARING ACOUSTICONS, but are reluctant to do so because of psychological factors? We believe we can help you break down their resistance and make them understand that Coronation Acousticons are no more conspicuous or inconvenient than eye glasses Won't you give us their names? We want to send them literature especially prepared to assist you in breaking down their psychological objections and make them cooperate with you and follow your recommendations Send us the names and addresses of these "hard to convince" patients Of course, your name will not be mentioned in our correspondence with them—unless you say so

See Acousticon at the Waldorf-Astoria



Don't miss Acousticon's exhibit in Booth 90 at the Annual Meeting of the Medical Society of the State of New York May 9th to May 12th 1938, New York City

The dinner shown above is typical of the substantial meals permitted with this new 1200-calorie diet planned by recognized authorities and used by thousands of physicians Supplied in handy booklet form for distribution to your patients, it overcomes the usual objections to ordinary reducing diets because

1. It provides for a safe average weight loss (about ¼ pound per day) without starvation methods, supplies adequate minerals and vitamins (with the possible exception of vitamin D)

2. It permits the use of the patient's favorite foods thus assuring adherence to the diet.

3. It simplifies food preparation The patient can select from regular home or restaurant menus.

Ry Krisp, so important in any reducing diet, contributes much to the success of this new low calorie diet. Made of whole rye, salt and water, double baked, it is safe, delicious and contains only 20 calories to the wafer Its high bulk efficiency also helps protect against common constipation

BASIC OPERATIONS IN COMMERCIAL CANNING PROCEDURES

III. EXHAUSTING OR PREHEATING

● Modern canning procedures provide for the exclusion from the sealed container of air, and other gases present in raw food material, to the greatest possible degree

In the sealed can, oxygen, in particular, is undesirable, whether it be released from food cells or be present in the form of entrapped air If present in the sealed tin container, oxygen can react with the food and the interior of the can and directly affect the quality, nutritive value and merchantable life of the canned food Other gases—for example, carbon dioxide produced by cellular respiration—should also be excluded as far as is practical If present in large amounts, these gases may place undue strain on the container during the heat process to which canned foods are subjected

In commercial canning practice, certain operations—specifically the blanch—may aid in elimination of gases from raw food tissues However, main dependence is placed upon what are known as "exhausting" or "preheating" operations, not only to expel gases from raw foods, but also to exclude air from the can

Briefly, the exhausting operation is accomplished by mechanically passing the open can containing the raw food through a so called "exhaust box" in which hot water or steam is used to expand the food by heat and drive out air and other gases contained in the food and in the can The times and temperatures used in commercial exhausting operations will naturally vary with the nature of the product (1)

After exhausting, the can is immediately permanently sealed, heat processed and cooled During cooling, the contraction of the heated contents of the can creates the vacuum normally present in commercially canned foods

With certain products, instead of exhausting as described above, the same effect is produced by preheating the food in kettles or similar devices, filling into the cans while still hot, and immediately sealing the containers With still other products, an exhausting effect is produced by adding boiling water, syrup or brines to the food in the can In some instances, exhausting is accomplished by mechanical rather than by thermal means Specially designed sealing or "closing" machines are used to withdraw air and other gases by applying high vacuum to the can and immediately sealing on the cover

Such in brief are the purposes of commercial exhausting operations and the means by which they are usually accomplished Modern canners recognize that these operations are most important to the success of their canning procedures They appreciate that only by strict supervision and control of exhausting operations can the quality and nutritive values of their products be maintained at a consistently high level

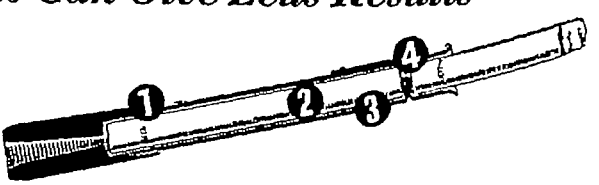
Your Patients Who Smoke Cigarettes May Be Asking About This—

IT'S CALLED **Zeus** —A New Idea—An Aluminum Filter-Holder which uses an extra cigarette as filter . . . and, by accredited laboratory tests, eliminates more than 70% of nicotine and tar products from cigarette smoke.



WITH MORE THAN a million men and women now using Zeus, many physicians have seen its application in their practice, and the following comments are typical

"A heart patient who has flatly refused to give up smoking is now using a Zeus holder, and it has decreased the skip from 1 out of every third or fourth beat to 1 out of every fifteenth or sixteenth "

Another writes, "A great step forward, as it largely prevents absorption of tar and other by-products of tobacco, and thereby offsets a possible stimulation of the gastric mucosa, which would result in hyperacidity, and likewise over-stimulation of the heart and irritation of the upper respiratory passage"

Full details about Zeus the tests that were conducted by leading scientific institutes will be gladly mailed you Please address your inquiry to the address shown below

Why Only Zeus Can Give Zeus Results

● THE ZEUS PRINCIPLE involves *more* than using an extra cigarette as filter Cheap imitations have not evidenced, in tests, Zeus efficiency

Only Zeus is backed by 3 years of official laboratory tests showing positive elimination of 70% nicotine and tar products from cigarette smoking

To achieve this high efficiency, *all* the smoke from the lighted cigarette must pass *through* the filter cigarette and not *around* it. This requires (1) an absolutely correct bit to form a perfect seal with filter-cigarette, so only filtered smoke gets through, (2) scientific design of the tube to allow for expansion of the filter-cigarette in absorbing the nicotine and tar from 30 to 40 cigarettes, (3) special type aluminum tube which condenses vapors in smoke as nothing else can

For the convenience of the user, all Zeus Filter-Holders are equipped with the Ejector (4), to expel short stubs

SOME UNUSUAL COMPLICATIONS ASSOCIATED WITH ABRUPTIO PLACENTAE

EDWARD C HUGHES, M D and ALBERT W VAN NESS, M D, *Syracuse*

Premature separation of the normally implanted placenta, known as abruptio or ablatio placentae, or accidental hemorrhage, constitutes one of the most formidable complications of pregnancy Its occurrence is probably more frequent than stated, and its diagnosis too often missed Development of this condition not only markedly increases mortality, but also is a main cause of fetal death In the majority of cases, the local condition within the uterus with its sequelae accounts for most of these deaths However, in a few individuals, separation of the placenta seems to be part of a general disorder which itself may become more serious than the local disturbance within the uterus This general change affects other structures and organs In many instances, death is the result of these changes rather than of the abruptio itself These cases become general medical as well as obstetrical problems

Although the etiology of abruptio placentae has never been clearly understood, and probably will remain one of the mysteries of medicine for some time to come, no doubt these local and general conditions are on the same basis In an investigation of sixty cases of definite abruptio placentae, occurring on private and ward services of Syracuse Memorial Hospital and Syracuse University Hospital, the age of the patient, the number of pregnancies, and as associated toxemia or nephritis seemed to be the important factors in their etiology Trauma was also noted as an associated factor

It was found that a greater number of separations occurred in women between the ages of thirty-one and forty years Also, the highest percentage occurred in patients having four or more pregnancies

TABLE I

	Nontoxic	Toxic	Total
Maternal death	0	6 2%	5%
Fetal death	41 6%	66 6%	61%
Shock	16 6%	41 6%	
Postpartum bleeding	17 %	45 8%	
Oliguria to anuria	0	22 9%	
Edema	0	70 7%	
Albumen	1+	1+ to 42%	

interesting to note that forty per cent of the entire group in this series occurred in connection with a severe type of toxemia

Mild	Severe	Nephritis	Trauma	Unknown	Syphilis
28 3%	40%	11 6%	5%	13 3%	1 8%
Total	68 3%	79 9%			

No doubt that in some of the 13 3 per cent in whom the cause was given as unknown, toxemia played an important part It would appear from observations of these findings and also from the reports of others that there must be two types of abruptio placentae The more frequent type is associated with some toxic condition, and the other is due to trauma and other conditions such as endometritis and syphilis The classifications, toxic and nontoxic, as suggested by Dieckman,[3] seem to be suitable It is also a fact that when the abruptio is of the toxic type the prognosis becomes more grave There is a greater possibility for other complications to occur such as changes in the blood, kidney changes, and alterations in the electrolytic elements of the blood These things have occurred in some of the cases in this series, and will be discussed later

That the toxic group offers a greater chance for complications to arise is shown by Table I

There also occurred tendencies to bleed from other sites in four cases of the severely toxic group The character of the blood in these four individuals seemed to change The bleeding time was longer, particularly in two cases No such things happened in the nontoxic cases Unfortunately, the only blood studies on most of these patients were the usual Hgb, RBC, WBC, and differential An average of these counts has been made and is tabulated in Table II The degree of the condition has been classified as mild, moderate, and severe in both groups

The hemoglobin, a good criterion of the degree of anemia was low in all types, indicating that in spite of rather large transfusions given, an anemia occurred The number of RBC were highest in the mild nontoxic type, and lowest in the severe nontoxic type This may be explained by the fact that in toxic patients there exists a higher Hgb and a larger number of RBC The relative leukopenia that existed in the severe toxic group was interesting Whether this indicates the severity of the condition or the result of the transfusions and intravenous glucose therapy, it is impossible to state This group of patients had received more blood and fluid, owing to their more precarious state

In a majority of the cases, the chief concern of the obstetrician is to control the hemorrhage, both before and after delivery The amount of hemorrhage occurring before delivery, either that remaining within the uterus—the concealed type—or that making its way to the outside—the revealed type—is dependent upon the degree of separation The actual mode of separation is probably the same in both groups There occurs, for some reason, an effusion of blood either in the decidua basalis or uterine wall As this accumulates, there occurs a separation of the placenta at this point No doubt small separations occur frequently and produce only slight signs and symptoms These patients go on to a normal termination of pregnancy However, no one knows how large or how small the area of the separation of the placenta may be In the more toxic types, the pathological changes do not remain localized in this area, but involve the uterine muscle itself This type of uterus, known as the apoplectic or Couvelaire type, is the most dangerous, the muscle being broken up and severely damaged Postpartum hemorrhage is frequent in this type, and one never knows when hysterectomy is

TABLE II

necessary When this type is present, one should always keep in mind the possibility of other general changes in the body (Fig 1-5)

When the blood accumulates under the placenta, it produces considerable irritation. The uterus immediately contracts tightly in an attempt to stop the bleeding The contraction becomes tetanic and gives the patient a continuous pain with intermittent cramps This was experienced by seventy per cent of the patients in the entire series If the uterus is of the Couvelaire type, as it frequently is when associated with a severe toxemia, the constant state of contraction is not so marked In fact, the walls of the uterus become soft and boggy, owing to the edema and changes present The tenderness remains, however, and becomes generalized over the surface of the uterus This type of uterus occurred fourteen times in the severe toxic type, and once in the severe nontoxic type Diagnosis of the apoplectic uterus was made by direct observation in six cases, and by the amount of hemorrhage and character of the uterus after delivery in the other cases

Associated with the changes of the uterus, a general systemic change developed in a few patients These individuals developed definite blood changes, and also had alterations in the function of the various organs, especially the kidneys Several authors have written about these things They have reported bleeding in other parts of the body—from mucous membranes, incisions, and even under the nails of the fingers and toes Williams [4] felt that in these individuals some material, resembling the toxins of vipers, was thrown out into the blood DeLee [5,7] has recorded a patient in whom the blood failed to clot Dieckman [8] and Dittman [9] have brought forth some interesting data on the blood chemistry and renal function findings in these cases They feel that there is a lowering of the blood fibrin, due to blood loss or immobilizing at the bleeding or placental site Other men have written of the anuria that occurred in cases of this character, and have reported deaths due to this condition [10-15] Reports have been made of the cortical necrosis of the kidneys in these cases We wish to add to the literature four more cases of this type They will be discussed briefly at this time

Case Reports

Case 1 A patient, thirty years of age, had had two pregnancies, both ending prematurely, seven months and eight months Her chart listed her as a chronic nephritic. During the eight prenatal months of the present pregnancy, nothing unusual happened. Near the end of the eighth month, she developed some edema, albumen in the urine, and toxic psychosis Labor started spontaneously After several hours there appeared some bright, red, vaginal discharge The fetal heart disappeared abruptly The uterus became tense and hard, and the pain was continuous The dilation of the cervix was then two fingers The membranes were ruptured manually The vaginal bleeding became profuse, and there developed a marked degree of shock However, just prior to delivery, her condition seemed to improve, and one hour later she delivered a stillborn child. After delivery, the hemorrhage from the uterus was severe, and the patient again passed into a deep shock. There also appeared a large ecchymotic spot on the left labia majora, and one over the lower abdominal wall This spot was about six or seven inches in diameter Although there had been some manipulation of the fundus, there did not seem to be enough to cause this ecchymosis There was a positive Cullen sign There were also ecchymotic spots on the thighs and legs At the same time, the patient started to vomit dark red fluid which contained old blood, and continued throughout the next twenty-four hours During labor and for twenty-four hours later, no urine was

Fig 1 Uterine muscle on left with decidua basalis on right. Separation takes place in either tissue.

passed When she was finally catheritized, fifteen to twenty c c of pinkish, cloudy urine was obtained The total intake during this time was approximately 5000 c c. of fluid, including 1300 c c citrated blood. This blood was given after delivery Laboratory reports of the urine showed many RBC, WBC, and casts The NPN was fifty-three mg per 100 c c of blood

The next twenty-four hours the output of urine was 575 c c and the intake 6660 c c The output gradually increased to normal in the next two days In spite of the fact that she had 1300 c c of citrated blood, a secondary anemia developed Hgb dropped from fifty-nine per cent (9 gm) to forty-nine per cent (7 5 gm) RBC dropped from three-four to eighteen WBC remained about the same, 19,500 with a differential of eighty-six per cent polys and fourteen monos

Recovery was slow, as the convalescence was complicated with fever This patient still possesses an hemianopsia

CASE 2 Gravida I, age thirty-three Prenatium had apparently been normal except for a mild toxemia at the end Patient was admitted to hospital in labor Membranes previously ruptured seven hours and pains had begun five hours before admission When the cervix became 4½ fingers dilated, there developed a large amount of bloody flow The fetal heart ceased, and the blood pressure dropped The uterus became very tense, and was in a state of tetanic contraction Several hours later, the patient's condition became worse, pulse weak, and the patient passed into severe shock but seemed to rally before delivery Baby was delivered by craniotomy Following delivery there was a massive hemorrhage from the vagina, estimated at 1½ quarts The uterus and vagina were packed tightly The next twenty-four hours, the patient

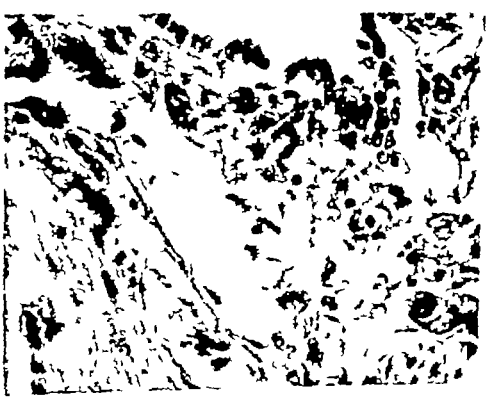

Fig 2. High power of uterine muscle in right lower corner with cells of decidua on right.

Fig 3 Section of placenta accreta. No decidua basalis found in this type of placenta. Separation cannot take place at this point

remained in severe shock most of the time Shortly after delivery, she started to have a more or less continuous regurgitation from the stomach of dark red bloody fluid which continued until death There also appeared an ecchymotic area about twelve inches in diameter on the abdominal wall deep red in color, and although there had been considerable manipulation, the amount of bleeding seemed more than could be expected Some small ecchymotic areas were noted on the arms and legs The intake of fluid the first twenty four hours after delivery consisted of 1400 c c. of citrated blood, 2200 c c of saline and intravenous glucose The total output during this time was only 120 c c of dark colored urine The next twenty-four hours, the intake was approximately 3000 c.c with an output of 108 c c The third twenty-four hours, the intake consisted of 1000 c.c. of citrated blood and 2500 c c of saline and intravenous glucose The total output was forty-five c c of dark colored urine Laboratory examination of the specimen showed RBC, WBC, and casts The third day the urine contained only RBC The patient died in severe shock before the third day postpartum ended Unfortunately, only one Hgb and RBC count was done, and is of little consequence Blood Na during shock averaged 145 mg , forty-eight hours later, 300 mg

CASE 3 A primapara, age nineteen, had been healthy and strong during pregnancy Labor started two weeks after the estimated date No signs of toxemia had been found at the clinic As labor started, she began to have headache and disturbance of vision with high blood pressure and albumen in the urine These became worse after she entered the hospital During the first stage of labor, the abruptio occurred Vaginal

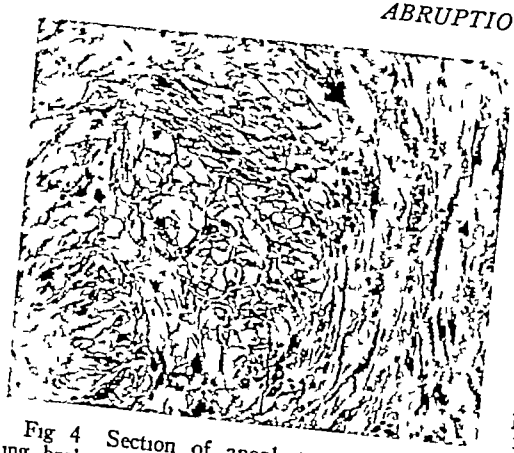

Fig 4 Section of apoplectic uterus, showing broken-up muscle cells, marked edema of muscle on right side, and some small areas of hemorrhage.

bleeding became profuse The uterus assumed the usual ligneous consistency The patient passed into severe shock, and the fetal heart disappeared The membranes were ruptured manually when the cervix was two fingers dilated Delivery was accomplished spontaneously two hours later During the latter part of labor, small ecchymotic areas appeared on the face, arms, and legs, with some larger hemorrhages about the vulva There was some bleeding from the gums She was transfused before and after delivery, and intravenous glucose was given almost continuously During the next twenty-four hours, 5400 c.c. of fluid was given by vein and clysis, and 700 c c of citrated blood was given The output was practically nothing during this time Examination of the urine showed many RBC, WBC, and casts During the next twenty-four hours, the output increased to 575 c c with an intake of approximately 4000 c c of fluid. Recovery was slow but complete The blood work is as follows

	1st day	2nd	3rd	4th	7th	8th
RBC	2,65			2 995	2,87

Case 4 Primapara, age thirty-seven Past history revealed that the patient had scarlet fever in childhood, with some kidney trouble She also had arthritis after the scarlet fever After extraction of a tooth, patient had a profuse hemorrhage Her prenatium progressed normally, except for some nausea and vomiting early, and development of a mild toxemia several days before labor Labor started with a sudden, severe pain in the abdomen At the same time the membranes ruptured, followed by a large amount of vaginal hemorrhage She entered the hospital twenty minutes later in rather severe shock The uterus was hard, tense, and in a state of continuous tetanic contraction The fetal heart ranged from 60 to 200 The maternal pulse was from 120 to 130, and the blood pressure was 80/60 There was a large amount of vaginal bleeding Diagnosis of abruptio placenta was made It was elected to perform a classical cesarean section for the following reasons (1) The patient's condition seemed too serious to tolerate a delivery below, (2) The head could not be engaged Ball technic had shown a plus 192 mm at the inlet, (3) It seemed the only way to save the life of the fetus

The section was done under general anesthesia As the uterus was opened, it was found to be filled with old clots A living child was delivered. Bleeding from the uterus was profuse and continuous The uterus also appeared grossly cyanotic and edematous The incision was closed with double layers of interrupted chromic No 2 and a continual layer of continual plain for peritonealization During the operation, the patient was given 600 c c. of citrated blood She was transferred to her bed in fair condition, although having more than the usual amount of vaginal bleeding Three hours later, the nurse noticed that the dressing had become saturated with blood The vaginal bleeding had become profuse and blood appeared from the transfusion puncture, the blood count puncture, and the gums There were ecchymotic

Fig 5 Gross placenta shows accumulation of blood in center, extending to one edge.

spots on the arms and legs She rapidly went into a deep secondary shock, in spite of ample intravenous glucose and more whole and citrated blood She remained in this deep shock for twelve hours During this time, the abdominal wound, although resutured, bled profusely The bleeding from the wound seemed to be a diffuse capillary one, and could be controlled only by manual pressure Twelve hours after the operation she was catheterized, and 100 c c. of dark red urine was obtained Examination showed it contained many RBC and WBC No casts or Hgb were found.

The next few days, she gradually improved from the shock, temperature varying from 99 to 101° F During this time her condition was not good, blood pressure and pulse hardly obtainable The ecchymosis gradually disappeared, and the bleeding from the wounds and other places was controlled

In summarizing the convalescence from this point, several conditions became problems

1 The problem of the kidney function, which had practically ceased
2 The problem of secondary anemia which was developing
3 The development of tetany with mineral changes became troublesome
4 Later development of polyneuritis of the nerves of the right arm and associated bony changes
5 The occurrence of arthritis three months and seven months after delivery

Chart I shows the function of the kidney During these ten days the patient remained conscious and presented no symptoms of uremia She developed some generalized edema, and the blood pressure elevated to 180/100 The abdomen which was distended was relieved with Wagenstein and Harris drip The abdominal wound healed by primary union After ten days, the urinary output started to increase and soon became a tremendous daily amount. On the ninth day, she began to have marked muscular twitchings followed by convulsions Her condition seemed precarious at this time, but after increasing the fluids, she seemed to improve considerably However, as the improvement occurred, the muscular twitchings became worse and a troublesome tetany developed These twitchings of the arms and legs were painful and annoying to the patient It lasted five or six days, gradually disappearing after treatment of calcium and parathormone Other signs of tetany were a blood calcium of six-eight mg, and a positive Chovetek and Trousseau sign The blood sodium, which during the last few months of pregnancy had ranged from 250 to 260 mg per 100 c c. of whole blood, dropped during the labor and for several days later to 150 and 160 mg A large amount of saline and glucose was given, and there was a gradual increase to 270-300 mg This was considerably over the estimated normal, probably the result of retention of urine.

The next factor which caused considerable worry was the progressive secondary anemia that was developing Chart II shows the change that took place in the blood picture During these days she developed some jaundice, and uric acid was found to be 8 5 mg

As soon as the kidney function was assured, two more transfusions of citrated blood were given The patient was also given liver extract and iron The improvement was slow but gratifying, and thirty-six days after delivery, she was discharged from the hospital Two weeks later, she noticed loss of motion of the right forearm and hand This was followed by pain in

the shoulder joint, and along the course of the nerves of the arm and forearm She then developed an arthritis of the shoulder joint and other small joints of the arm and hand No foci of infection could be found, and gradually she improved and resumed a normal life

Seven months after delivery, she had a tooth extracted, and the arthritis started again At present, she is being treated for that condition Her blood count is characterized as follows Hgb eighty-one per cent (13 5 gm), RBC 4,070,000, WBC 7,000, polys thirty-seven, lymphs fifty-two, large monos seven, reds well-filled.

Discussion

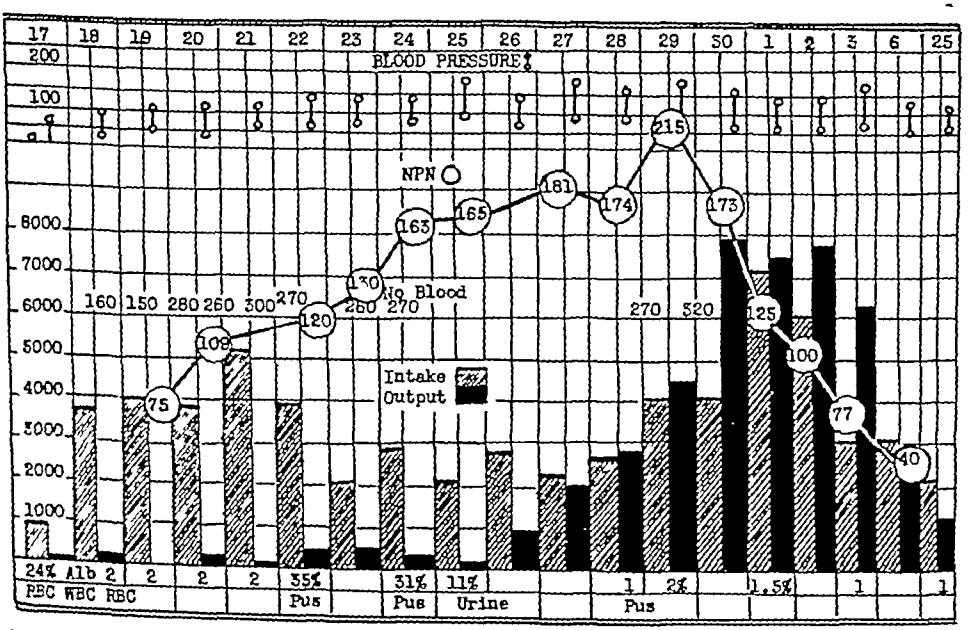
An analysis of sixty cases of definite abruptio placentae has been made It is felt that when there exists premature separation of the placenta together with a toxemic state, most anything can happen When such situations occur, there is a general systemic effect and one must be prepared not only to treat the local disorder, but must also anticipate blood changes and kidney disturbances

It may be possible that in individuals of this type, a toxic abruptio of the placenta may be the cause or result of an atypical purpura The fact that the bleeding time and platelet count were altered is suggestive. This purpura could be explained in several ways

1 It may be due to liver damage in connection with the toxemias of pregnancy

2 It may be due entirely to blood loss

3 It may be due to an increase in the stabilizing material in the plasma after excessive bleeding This may also be the result of liver damage



4 As Dieckman suggests, it may be due to a lack of fibrinogen

5 It is possible for patients to assume purpuric tendencies after large quantities of blood have been given. However, no reactions were obtained after any of the transfusions No blood was used unless it matched both ways and no such reaction has been noted when large quantities of blood have been given for other conditions

It is interesting to note the amount of secondary anemia that developed in these four cases, the blood decreasing considerably in spite of the rather large transfusions that were given In the three cases that survived, the return to normal was extremely slow No doubt, the toxemia present played an important part in this retardation

The function of the kidney played a definite role in the prognosis of these cases In two of the cases, the function was soon returned to normal The lack of urine in these may have been based upon the toxemia alone. However, both showed that the urine was definitely bloody The lack of kidney function

CHART II

contributed definitely in the one death Whether this oliguria and anuria is part of the prolonged shock, loss of water, cortical necrosis, tubular plugging or part of the general toxic state, it is impossible to say It must be remembered that this does exist, and that as an important part in the treatment of abruptio placentae, it is necessary to increase the fluid intake markedly, particularly by the venous route

It is also possible that the electrolyte balance is affected in this situation This was shown by the changes in the blood sodium in two patients, and the lowering of the calcium and appearance of tetany in another Blood sodium estimations were done by the spectrographic method on whole blood

Conclusions

1 The toxic type of abruptio placentae is the most dangerous

2 There are changes in the blood, kidneys, and other structures in the toxic type

3 These patients may show an atypical purpuric tendency

4 Blood transfusions, although an absolute necessity, must be given with care.

5 Large quantities of fluid are necessary to the patient

6 The electrolyte balance probably is affected and this should be considered in planning treatment.

Discussion

Dr James K Quigley, *Rochester*—Dr Hughes experience in unusual complications of abruptio is, I think unusual, but might not these symptoms have resulted either from the transfusions or from vitamin deficiency? Sir James Young in a paper in a recent issue of the *British Medical Journal* proves the correlation of habitual abortion, some toxemias and abruptio, and ascribes the etiology to a lack of the corpus luteum hormone and lack of vitamin E Shute also suggests vitamin E deficiency as a cause, not only for habitual abortion but the similar condition, abruptio

The textbook picture of abruptio is so obvious as not to escape recognition, however by this time both mother and baby may be in jeopardy De Normandie and Shute both emphasize the importance of recognition of the milder forms of separation, the only symptoms of which may be sacral backache with a circumscribed tender spot in the uterus usually without external bleeding

The extent of placental separation does not always indicate the amount of hemorrhage Only two days ago I sectioned a case in the ninth month because of two rather sharp hemorrhages with a three weeks interval and a tender area in the fundus, and found a relatively small marginal separation

Abruptio may not be due to toxemia, but as both may have a common etiological factor, it would seem as though the cause of abruptio may be near solution

Dr Raymond J Pieri, *Syracuse*—In reviewing Dr Hughes' excellent paper, three important points appear to warrant additional emphasis or repetition

First, that in severe abruptio placentae there may result profound changes in the blood, the exact nature of which is not understood Indications point to some disturbance of the electrolytic balance. Whether this is a phenomenon associated with the profound acute blood loss, or is a result of the measures instituted to combat this (intravenous blood, saline, glucose, etc.) is not yet clear

Second, that oliguria and anuria are not uncommon, that kidney disease *per se* does not alone explain the acute onset of these manifestations, and that persistent anuria may be a contributory cause of death in a certain number of cases

Third, I wish to express a word of commendation for the rather unusually complete laboratory data presented by Dr Hughes in connection with certain of his cases More study by all of us in this direction may provide us with valuable information concerning the unusual clinical pictures which abruptio placentae sometimes creates

TUBERCULIN-TEST OF SCHOOL CHILDREN

Comparative Values

G W Weber, M D, *Albany*, F W Holcomb, M D, *Kingston*, and K. M Murphy

In view of the diverging opinions lately expressed as to the value of the tuberculin-test of school children and the importance of the role it should play in tuberculosis control, we wish to review a three-year test program which was carried out in the public schools by the staff of a County Tuberculosis Hospital and to compare its results with the results obtained by the routine examination of contact and suspect cases made in the same hospital during the same period

We will limit ourselves to an analysis of the method solely as a means of detecting the adult type of tuberculous pulmonary lesions This preliminary distinction is necessary A program which would extend to the discovery and also care of childhood type of lesions, would be wider in scope and would require a more complete organization, including a preventorium and continuous supervision of the children affected, the expenses of which few communities are ready to meet at the present time

The survey under consideration was carried out in Ulster County (New York State), which has a population of 80,000 —half urban and half rural Its anti-tuberculosis organization is centered in the Ulster County Tuberculosis Hospital which is only equipped to take care of the adult type of pulmonary lesions and which is also in charge of all extramural activities

In previous papers the essential features of this program have been outlined [1,2] The usual routine of educational preparation of the field through lectures and press propaganda was adhered to The Mantoux test was used throughout

As a result of the many surveys made in several parts of the country during these past years, especially in Massachusetts which have shown that the amount of clinical tuberculosis found among the grade school positive reactors is very small, the general consensus of opinion today seems to be that the test will produce its best results if applied (1) to the high school students, whose positive reactors would then be x-rayed or (2) to the entering pupils of the primary schools In this case, the adult household contacts of the positive reactors should be examined in an attempt to trace the source of infection This program, however, is not practical in all cases In most rural schools, for instance, several grades are grouped together Also, the several grades do not enroll the same age groups, and while in a rural school we may find pupils sixteen years old, we find in the high schools, children as young as twelve

Because our survey, besides case finding, had also propaganda purposes and because we wanted to offer our services to the rural as well as to the urban communities, we decided to apply the test to children of all ages When our program was actually well-organized and started, we found that it took little more effort to survey a whole school than a class or two From the very beginning we made it our firmest rule not to examine any grade school positive reactor unaccompanied by at least one responsible member of the family, in fact, we endeavored, whenever possible, to examine all the adult household contacts Consequently, we believe that ours is one of the few surveys of such extent in which a large proportion of household contacts has been examined

An important feature in our technic was the use of the fluoroscope as a first screen instead of the x-ray film Numerous records of those experienced with both types of examinations satisfactorily prove that the fluoroscope will reveal to the trained eye any significant parenchymal lesion It enabled us to reduce the number of films to be taken from between eighty-five to ninety per cent When one

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

considers that the cost of a finished film is around seventy-five cents while the cost of the fluoroscopic examination has been estimated at about fifteen cents per capita, it is easy to foresee the economy that can be effected This item is very important in communities which have long since gone off the prosperity standard

During the three years under consideration, we tested 8,953 grade school pupils, 2,113 high school students, and 380 normal school freshmen, a total of 11,446 Respectively the positive reactors were 1,242 (13 8%), 575 (27%), and 147 (36%), a total of 1,964

The individuals examined were 828 grade school pupils, 667 high and normal school students, and 984 adults, a total of 2,479 For practical reasons we have classified the normal school freshmen with the high school seniors, with the exception of a few over twenty years of age who have been classified as adults

The findings of these examinations, limited as we have said to the pulmonary lesions of adult type, are reported in Table I

In Table II we have classified the children examined and those found with lesions according to age groups We have also tried to tabulate in the same table the adults examined and those found with lesions according to the age groups of their children As some of these adults had more than one child, we have classified them according to the age group of their youngest child

The study of the figures relating to the adults is of some interest We can see that the number of cases found among them does not vary greatly according to the age groups of their children Therefore, the assumption, theoretically sound, that we would find proportionally more cases among the household contacts of the positive reactors of the first grades is not confirmed in our survey by actual results We are unable to explain this discrepancy In fact, we failed to find a single case of tuberculosis among the adults whose children were younger than nine years, and furthermore, if we had classified the adults who had more than one child positive reactor in the age group of the oldest child, we would have found only four cases belonging to the household contacts of children ten years or younger

The number of cases found among adults was 3 4 per cent of the examinations and three times larger than the number found among the pupils The stages of disease for the two groups were eight minimal, one moderately advanced, and one advanced, for the pupils, for the adults, twenty-one minimal, nine moderately advanced, and one advanced This gives an average proportion of seventy per cent minimal lesions

How do these figures compare with those produced by the routine examination of contact and suspect cases? During the three years considered in the above survey, the hospital conducted regular biweekly clinics to which household contacts of known cases and individuals with suspicious symptoms were admitted From November 1, 1933 to September 1, 1936, a total of 1,843 new patients of these two categories were examined and x-rayed with the resultant discovery of 227 new cases of tuberculosis, or a little more than eleven per cent, in the following stages seventy-nine minimal, seventy-six moderately advanced, and seventy-two advanced—an average of thirty-five per cent minimal lesions

It is evident from the above figures that the numerical advantage rests with the contact-suspect-case examination method, which yields by far a larger number of new cases of tuberculosis On the other hand, the tuberculin-test method appears to lead to the discovery of twice

TABLE I

	Minimal	*Moderately Advanced*	*Advanced*
Grade Schools	3		1
High and Normal Schools	5	1	
Adults	21	9	1
Total	29	10	2

TABLE II

	Up to 10 years	*11–15 years*	*16–20 years*
Number of children examined	349	654	492
Children found with tuberculosis	1	2	7
Number of adults examined for each age group	426	431	44
Number of adults found with tuberculosis	14	13	4

as many cases with minimal lesions, and it is upon this fact that much emphasis has been placed by several writers who advocate it Dr William Paul Brown, for instance, in a comparative study of economy in tuberculosis case-finding through the schools, reviews also the results obtained by the traveling clinics of the New York State Health Department in the examination of suspect-contact cases Noting that only forty per cent of the cases found through these clinics were in the early stages, he asks "Should not this conspicuous failure . . move us to try other methods of case-finding even though such methods are less productive and more expensive?" [3] In our opinion the New York State Clinics cannot be taken as an indicative basis for comparison They are not permanent and they do not reach "typical groups" unless we consider the individuals examined by them as typical of communities where no active and efficient anti-tuberculosis organization exists and where, as a result, we would expect to find a large percentage of advanced lesions Early discovery of the disease depends on several factors beside the method used The education of the public, the cooperation of the medical profession, the establishment of good field nursing service, etc., all contribute to the fulfillment of this purpose. A more detailed analysis of our figures, for instance, will lend support to this point Our hospital was opened at the end of 1931 and did not start an active routine Clinic service until the beginning of 1933 Due to the hearty cooperation of the local physicians, to an intensive educational program, and to efficient field work, the percentage of minimal lesions among the contact-suspect group in the past three years has steadily and gradually increased as follows

Sept. 1933 Sept. 1934	Minimal 23%	Advanced 45%
Sept. 1934-Sept. 1935	Minimal 27%	Advanced 31%
Sept. 1935-Sept. 1936	Minimal 50%	Advanced 21%

Moreover, there is another important consideration to be made In evaluating either method we must not be content to draw conclusions from statistics alone The importance which the newly discovered cases have as public health problems, and how many of them as such are to be considered potential sources of infection and therefore in need of supervision and treatment, must also be taken into account Dr Korns, in a recent paper, has pointed out that "the solution of the problem of tuberculosis eventually will lie not so much in early diagnosis as in prompt diagnosis and isolation of open cases to minimize contacts after these cases become communicable" [4]

Undoubtedly, most of the cases detected through the regular clinics had active lesions They came to us either because symptoms or physical signs had led their physician to suspect the disease, or in the case of contacts, because they were the possible infecting source or infected victim of the original known case. Therefore, their lesions, when discovered, were all clinically significant to us, even if minimal

Altogether different seems to be the condition of the group of patients found through the tuberculin-test survey While, of the ten school pupils, eight had active or suspiciously active lesions, this was so only for sixteen of the thirty-one adults, and among them only six of the twenty-one we had classified as minimal Therefore, if it is true that the tuberculin-test method results in the detection of a higher percentage of minimal lesions, it is also true that the routine clinic examination produces a higher percentage of active lesions, which is what interests us from the public health and tuberculosis control point of view

Parenthetically, we may note that the distribution of the sixteen adults with apparently active lesions had no particular relation to the age of their children Nine of them were parents of children in the age group six to ten, and seven, of children in the age group eleven to fifteen

The comparative per capita cost is also an ever present subject of discussion Unquestionably, the tuberculin-test method has proved to be the more expensive. In those communities where its application has required the organization and upkeep of an entirely new and independent unit, and especially where the positive reactors alone, without their parents, have been x-rayed, the expense has been entirely out of proportion to the meager results obtained, with consequent disparagement of the method However, we cannot base a cost analysis on these instances If we consider a tuberculin-test

survey developed collaterally as an extra duty activity by the full time staff of a tuberculosis hospital, which is already conducting a well-organized clinic, then the extra expense would be limited to the cost of the x-ray films, and of a few incidentals which would keep the per capita cost low enough to make such a survey, if not highly productive, at least sufficiently attractive from the financial point of view This will be more so if the fluoroscope is used as a first screen

We have so far considered the immediate practical results of the two methods and their economics The conclusion as to their comparative merits is obvious

But there is another value in a tuberculin-test survey—a value which we believe transcends even that of the clinical aspect, namely, the education of the public The general information which is disseminated preparatory to the actual testing constitutes a form of propaganda which cannot be equalled in any other way We gave many informal talks to various groups and meetings throughout the county, thus gaining ample opportunity for explaining and discussing the problem of tuberculosis Through this medium we reached a large proportion of the population which it would have been difficult to reach otherwise Still more important, the examination of the parents has brought them in direct touch with us as we have always made it part of our policy to have a personal interview with each family before the examination, explaining to them the meaning of the test, of the positive reaction, and the advisability of the examination The fluoroscopic examination which was carried on in family groups greatly impressed them and helped in their understanding of our purpose In this way we directly contacted about 550 families in all walks of life who will in the future, we hope, contribute their measure to health propaganda in their respective communities

Dr Korns in the paper cited above writes "The x-raying of high school students, while it may reveal little significant tuberculosis, has educational value, as it makes it more likely that students examined in this way will in the future submit to or even seek an x-ray examination should it seem desirable" And we have direct proof to support that. A year ago, curious to ascertain what educational results, if any, our campaign was having among our people, we decided to submit a set of questions to the senior students of our largest high school Many of them had been tuberculin-tested and fluoroscoped, but had never been given lectures relating to the subject and, therefore, we felt that their answers would reflect, more or less, any discussions which might have taken place in the family group By way of comparison we put those same questions to the senior students of two high schools of two contiguous counties where practically no tuberculin-testing had ever been done The answers of our 425 students had a decided advantage over the answers of the 519 students of the other two schools The best illustration is the question, "If you were fearful that you had pulmonary tuberculosis or 'lung troubles' what would be the best method of determining this?" Our students answered correctly (x-ray or fluoroscopic examination) in the proportion of sixty-seven per cent to seventeen per cent of the students of the other schools

Viewed under this light, there is no question that the tuberculin-test has its own place, and a very valuable one in the anti-tuberculosis set-up However, as a case-finding method it has its limitations and, therefore, it cannot and should not be considered as a substitute for the more effective, more productive, and coeteris paribus, more economical method of contact-suspect case examination

CARCINOMA OF THE SKIN

Practical Phases

JOSEPH JORDAN ELLER, M D, *New York City*

Skin carcinoma, because of its accessibility, offers opportunity for early diagnosis and adequate therapy In no other field is it possible to obtain such good results Despite this, the United States Public Health Service reported in 1934 that there were approximately 3,300 deaths from skin cancer or about three per cent of the aggregate mortality from cancer of all types and locations Today the responsibility is on the general practitioner as well as the specialist, for lowering the mortality rate of cancerous skin tumors

Malignant skin tumors are best classified according to their histopathology They may be placed in two main groups according to whether they arise from epithelial or connective tissue elements Malignant growths arising from epithelial cells are called epitheliomas or carcinomas, those originating from connective tissue are called sarcomas In this paper, only the malignant neoplasms of epithelial origin will be discussed These constitute the vast majority of malignant new growths found in the skin The melanoma group, carcinoma of the mouth, and also the subject of sarcomas will appear in subsequent articles

The epidermis consists of several layers, all representing the normal changes which the epithelial cells undergo as they grow from the lowest layer toward the surface. The lowest layer (stratum basale or str Malpighi) consists of large columnar cells which divide by mitosis, thus forming other cells which, during their advance toward the surface, are subjected to a gradual process of keratinization

The classification of skin carcinoma depends on the type of epidermal cells which is found in the epithelial new growth *first*, the basal-cell tumor consisting of basal cells, *second*, the squamous-cell tumor in which the prickle cells predominate Mixed tumors containing both epidermal elements are not uncommon and are called basal-squamous-cell epitheliomas

As a third supplement to the two main groups may be considered the intraepidermal epithelioses (Bowen's disease, Queyrat's erythroplasia, and other conditions) whose cells possess characteristics of malignant degeneration, but still remain localized within the epidermis, at times they may break through

The above classification is, of course, rather broad, and cannot be regarded as completely applicable to all conditions, but the terminology of the mentioned new growths has proved practical for the establishment of a therapeutic regime and for the determination of the prognosis, since the pathologic findings as well as the location must in all cases indicate the methods to be employed in the treatment

Cutaneous epithelioma frequently originates in apparently normal skin, the larger percentage, however, may be observed in previously altered skin These changes may be caused by intrinsic or extrinsic factors which originate either from normal physiologic processes or from abnormal influences Senile atrophy of the skin, at times prematurely produced by prolonged frequent exposure to sun, wind, etc, is a predisposing factor in the formation of skin epitheliomas Carcinomas of the skin may arise in areas of chronic inflammation The prototype of this class is the "lupus cancer" Other skin conditions which may assume malignant degeneration are nevi, condylomas, roentgen ray or radium dermatitis, persistent tar irritations, leukoplakia, and others

Squamous Cell Carcinoma

Although the squamous cell carcinoma is not seen as frequently as the basal cell type, it is much more important because of its highly malignant character It grows more rapidly and may metastasize early, therapeutic measures may be less effective, and when unrecognized or inadequately treated its course may frequently be fatal The prickle (squamous) cell carcinoma usually occurs singly This neoplasm most frequently is seen in the fifth or sixth decade of life, but it may

Fig 1 Basal cell epithelioma showing destruction of eyeball

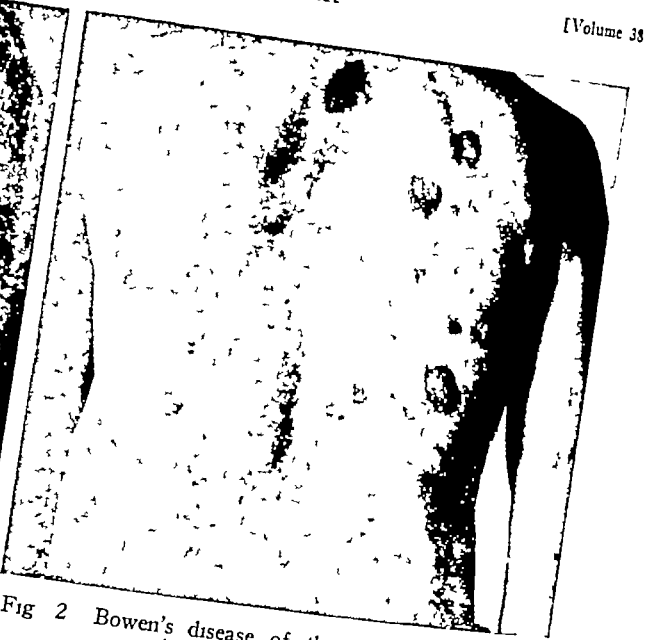

Fig 2 Bowen's disease of the skin. (Corroborated by microscopic study)

occur at any age It is extremely rare in the colored race While no area of the skin is immune, the most frequent sites are the mucocutaneous junctions of the mouth or the genitalia, or on the skin of the extremities

The tumor sometimes arises from apparently normal skin or it may have its origin in skin which has previously undergone other pathologic changes Its initial appearance is difficult to recognize as a malignant growth A small papule or a slightly infiltrated wart would scarcely excite suspicion of a beginning cancer Later the tumor may ulcerate or bleed easily on trauma, thus for the first time

Fig 3 Basal and squamous cell epitheliomas developing on xeroderma pigmentosum.

Fig 4 (*left*) Basal cell epithelioma of eight years duration, undertreated by x-ray and radium with recurrences Removed by surgical excision and plastic repair Fig 5 (*right*) Same case showing cosmetic result.

suggesting the presence of a malignant lesion

The squamous cell epithelioma in the skin usually grows very slowly but may metastasize early, evidence of local destruction in the surrounding tissue sooner or later makes its appearance The lesions vary from a ¼ cm to several inches in diameter and may assume various clinical characteristics In the beginning the tumor may be verrucous, papillomatous, nodular or crateriform with the edges rolled, ridged or irregular The necrotic base of the ulcerated lesions is frequently covered with a firm adherent crust

In its further development the growth may locally involve the subcutaneous structures, such as fascia, muscle, and bone In the early stage of infiltration the regional lymph nodes may be affected individually and may be freely movable. Later, however, the lymphnode capsules may break down with subsequent infiltration of the tumor cells into the surrounding area. Then generalized carcinomatosis and possible secondary infection may lead to a fatal termination Despite the many clinical forms which the squamous cell epitheliomas may assume, there are certain definite symptoms which aid in diagnosing the disease Usually slight trauma to these lesions may cause bleeding The classic symptom of the so-called

Fig 6 (*left*) Epithelioma of left temporal region of eight years duration undertreated by irradiation with recurrences Fig 7 (*center*) Same case showing extent of excision by scalpel Fig 8 (*right*) Same case showing successful skin graft with full thickness of skin taken from pubic region for retention of hair

Fig 9 Epithelioma with radium ulcer of nine years duration Treated by means of surgical excision with full thickness skin graft taken from behind ear

"cancer pearls" is almost pathognomonic for the squamous-cell cancer These horny pearls are small globules resulting from the keratinization of the carcinoma cells and on slight pressure can be squeezed from the tumor mass They may be observed with an ordinary lens Another characteristic which is sometimes seen is the peculiar hardness of the base or the edges of the lesion This symptom may be so marked that at times the cancer is mistaken for a chancre The presence of regional lymphadenopathy would render this error more likely but negative findings from repeated darkfield examination would soon clarify the situation

Squamous cell cancer can simulate other dermatoses and for this reason the true nature of any such lesion should always be determined by microscopic study of a section of tissue The biopsy should be performed as early as possible, for if malignancy exists delay in therapy may lessen the patient's chances The biopsy, however, is not without an element of danger, since slight trauma in some instances may stimulate the cancerous tissue Therefore, it should not be performed unless proper therapeutic procedure can be followed shortly In certain cases, all necessary preliminary arrangements for such procedure should be made, if possible, before the tissue specimen is taken The microscopic study will determine the therapy depending on the type of growth and degree of malignancy

In considering the prognosis of squamous cell carcinoma, one must not be misled by any misconceptions regarding the relative malignancy of these tumors as compared with neoplasms of other organs Because the physician is often able to observe the evolution and growth of the cutaneous cancer, he should not be led to procrastinate, but should regard it as a disease which greatly endangers life The earliest possible destruction of a squamous cell cancer is necessary to avoid metastases

The prognosis depends upon the extent to which the cancer cells have spread around the primary focus and whether or not the lymphatic system has been invaded The problem of dealing with metastases must be envisaged from both the surgical and radiologic viewpoints

Basal Cell Carcinoma

The basal cell carcinoma is the type of epithelioma most frequently seen on the skin As already explained this disease produces characteristic histologic and clinical features which are essentially different from those displayed by the squamous cell cancer

Several observers have demonstrated that the individual lesion may have multiple points of origin Their site of predilection is on the face but they may be found on almost any area of the skin Like other epitheliomas, they usually

Fig 10 Same case as Fig 9 showing cosmetic result

occur in persons between forty and sixty years of age, although they have occasionally been seen in children They may involve areas of skin ranging in size from a pinhead to several inches in diameter and may differ greatly in their clinical appearance They may be superficial or deep, nodular or ulcerative

At times they may be papillomatous or fungating from the beginning The typical basal-cell epithelioma, however, usually begins as a small, slightly elevated nodule, having a rolled or pearly border and a surrounding zone of erythema with or without telangiectases On palpation it is hard and slight trauma may produce bleeding In its further evolution, ulceration and superficial extension may occur The designation "rodent ulcer" has been applied to this clinical type A bloody crust sometimes covers the crater, which upon removal may expose a small amount of pus, indicating the presence of secondary infection Attachment to adjacent or underlying structures may be observed, depending upon the site, the depth, and the evolutionary stage of the lesion

Fig 11 Squamous cell epithelioma involving mucous membrane of entire right cheek, duration about one year Treated by means of gold radon implants and roentgen rays given through external part of cheek. Radiation also to glands of neck.

Fig 12 Same case as Fig 11 showing result with no recurrence in four years

The basal cell epithelioma practically never metastasizes Those rare instances in which basal cell carcinomas have been reported as having metastasized are open to question It is the author's belief that if serial sections of such cases are studied microscopically, they will invariably prove to be mixed types of basal cell and squamous cell epithelioma In order to avoid such possible error, the specimen of tissue taken for biopsy should be sufficiently large, and if indicated, several sections from different levels could be examined

From the clinical viewpoint the basal cell carcinoma is regarded as relatively benign It grows very slowly, and on rare occasions has been reported as healing spontaneously Notwithstanding, it should never be regarded as harmless, for if left untreated, or if insufficiently treated, it may undergo rapid growth penetrating and destroying the underlying tissue even to the periosteum and bone Basal cell epithelioma has been known to have caused the destruction of so important an organ as the eye It may cause seri-

ous cosmetic damage. Finally, as has already been mentioned, the previously normal squamous cells, neighboring upon the basal cell epithelioma, may assume malignant qualities under the stimulus of the chronic irritation resulting from the products of abnormal cancer cell metabolism. This process would change the characteristics of a basal cell carcinoma which would then assume those of the more malignant squamous cell carcinoma.

In the literature certain forms of basal cell epithelioma have been described as containing excessive pigment. The recognition of these so-called "pigmented basal cell epithelioma" is important because without histologic examination this form may easily be confused with a melanoma. In view of the mistaken preoperative diagnosis of melanoma made in one of the writer's cases, as well as in several other instances reported in the literature, it is not unlikely that a considerable number of similar lesions have been mistakenly reported as treated, cured melanoma. In view of their pathology, their clinical course, their prognosis and treatment, these lesions really belong to the group of basal cell epithelioma with pigment.

Aside from these instances, basal cell cancers are not always easy to diagnose clinically. Since it is almost impossible to determine the real character of the epithelioma by clinical observations only, the same directions should be observed as were mentioned with respect to the squamous cell epithelioma, namely (1) take a biopsy for microscopic study at once when a lesion is suspected of being a cancer, (2) follow the biopsy with adequate treatment as early as possible.

Fig. 13. Squamous cell epithelioma of left side of tongue in patient with lues. Excision by high frequency knife and therapy with permanent gold radon implants through left side and base of tongue.

Fig. 14. Same case as Fig. 13. Gland appeared in side of neck three months after excision and radium therapy to tongue and roentgen rays to neck. Block dissection done. No recurrence in seven years.

Intraepidermal Epitheliomatoses

In addition to the described cutaneous cancers, there are other comparatively rare conditions having a certain relationship to carcinomatous changes in the skin. They each have specific clinical as well as histologic characteristic features. Their activity may be confined within the epidermis for many years. However, any of them may spontaneously assume more malignant characteristics. It cannot be definitely stated whether these diseases are slowly growing superficial carcinomas or dermatoses

sui generis (precanceroses) which may undergo carcinomatous changes sooner or later At any rate, their relationship to the cutaneous cancer is obvious and important

Multiple superficial flat epithelioma is the first of these conditions in which the cells are quite similar to real cancer cells While most lesions show cells of the basal cell type, some contain squamous cells or, more rarely, mixed basal and prickle cell elements The eruption is usually found in persons between thirty and sixty years of age. It originates in apparently normal skin without any manifestations preceding it There are practically no subjective symptoms The mature eruption presents multiple reddish-brown discoid lesions which are almost level with, or slightly below the surrounding skin While they are usually found on the chest, back or abdomen, they may occur in almost any region Patches vary in size from $\frac{1}{4}$ inch, to areas seven to eight inches in diameter There may be five, ten, or even hundreds of discrete individual lesions While some of the mature lesions may resemble an ordinary basal cell epithelioma, others may simulate a chronic dry eczema or even patches of psoriasis, Bowen's disease, arsenical keratosis, or the discoid forms of lupus erythematosus

Among the significant features in diagnosis is the presence of a very slightly elevated, thin, waxy, palpable border In most instances the waxy line is seen only when the skin is stretched Another significant sign is that infiltration is absent in most of the patches, their surface being smooth Other longstanding lesions, however, impart a sense of resistance to the palpating finger Occasionally, telangiectasia and central atrophy in the scars may be present The lesions usually do not undergo central erosion or ulceration

Another condition belonging to the intraepidermal epithelioses is Bowen's disease This lesion is characterized by

Fig 15 Kraurosis vulvae with development of prickle cell epithelioma. Note atrophic and glistening mucous membrane (This illustration appeared in the *British Journal Derm & Syph*, 42.263, 1930)

lenticular or discoid papules of rose, fawn, or brown color, some of which present a central depression, while others are villous or papillomatous They have a tendency to become confluent and form large plaques which may be covered with firm, greyish, adherent scales or crusts, which when removed reveal usually a moist and oozing base but which may be smooth or papillomatous The papules may be nonelevated, rounded or irregular patches which are sharply defined Sometimes the surface presents an atrophic appearance Bowen's disease may occur at any age and both sexes are equaly affected The lesions are usually multiple and distributed on the trunk, the limbs, and occasionally on the face There is no tendency to symmetry Some patients complain of a mild pruritus, while others are troubled with slight discomfort from pressure of

the clothing The disorder is extremely chronic, very slowly progressive within the epidermis and the lesions may be present and unchanged for many years

Erythroderma of Queyrat is a third group of the so-called "precanceroses" The cases described in the literature give the impression that the lesion always becomes a malignant neoplasm This condition appears on the penis, more frequently the glans and the inner part of the prepuce, the glans clitoris and other parts of the vulva, the lips and buccal mucosa, but rarely the skin itself The erythroplasia is formed by one or several circinate, slightly elevated, red lesions of different sizes, mostly smooth, shiny and

Fig 16 Squamous cell epithelioma developing in lupus vulgaris lesion

dry, very rarely oozing and eroded There are no scales and crusts Before the lesions assume malignancy, they may exist unchanged for many years

Perhaps the most frequent and important of all endoepidermal epitheliomatoses is "Paget's disease of the nipple," which is seen usually in women over forty years of age It generally begins as a keratotic erythema of the nipple, associated with some pruritus, and soon develops into an eczematoid condition of the area, spreading over parts of the breast and producing a moist, slightly indurated erythema The surface may become partly eroded and covered with crusts or fine scales The condition may further spread to the axilla and even cover a large portion of the chest The nipple may be retracted in more advanced cases Occasionally, before any dermic lesions are seen, a serous exudate may be present on the nipple

Paget's disease of the nipple has also been observed in several cases in extramammillary regions of the body, such as the abdomen, arms, neck, and face, where it presented the histologic characteristics

The disease assumes a special place among the canceroses of the skin, for in a great percentage of the described cases, real cancer of adjacent tissue could be found especially in the milk ducts This fact gave the impression that all the cases of Paget's disease might be intraepidermal metastases of an existing carcinoma, corresponding to the nodular skin metastases In other cases, however, even very thorough examinations failed to reveal the primary cancer Therefore, we have to consider at least a part of the cases as real "canceroses" or primary intraepidermal epitheliomatosis with intraduct invasion The presence of this condition should make one suspicious of concealed cancer in every case

Treatment

As the various cancerous skin lesions may change their character and malignancy, the one common principle to be followed is early eradication of the lesion It may be emphasized once more that the interval between biopsy and radical treatment has to be restricted to a minimum, since partial excision may be a provocation of the malignant growth which is left *in situ* Small suspicious tumors are better excised *in toto*, and examined histologically for determining the type of malignancy, and the indication for further treatment.

The only reliable methods which have stood the test of time are surgery, roentgen rays or radium (Included as surgery are the excisions by scalpel or the high-frequency knife, and destruction by electrocoagulation or thermocautery) Only practical experience guides one to judge which therapeutic procedure is indicated in the individual case It may be said that surgery and irradiation are measures which work differently, both of which

Fig 17 Squamous cell carcinoma of lower lip removed by high frequency knife. Filtered x-rays to neck.

should be applied in order to utilize every possible agent placed at our disposal Each case, however, must be considered as an individual problem The anatomical location, size of the lesion, infiltration, the age and the general condition of the patient, all determine the therapeutic regime to be selected

Surgical excision is definitely indicated where the skin cancer has infiltrated neighboring organs or involved the lymphatic system While the cosmetic results in the treatment are to be considered, they should not influence the adequacy of the treatment Parts of the bordering healthy tissues should be removed with the local lesion The removal or destruction may be done by the scalpel, or by the so-called high frequency knife, electrocoagulation or the actual cautery

Irradiation includes the application of roentgen rays and radium which have almost identical effects on the cells, but radium can often be more conveniently employed because of the flexibility of its application Radioactive substances may be used in the form of plaques for surface irradiation or in form of needles and so-called "seeds" for interstitial therapy The quality and quantity of roentgen rays must be adapted to the individual case While small and flat epitheliomas may be treated by a single massive dose of relatively soft, unfiltered roentgen rays (2000-4000 r), larger infiltrating tumors, especially those of the prickle cell type, require large doses of hard roentgen rays given in divided amounts at proper intervals

Irradiation with roentgen rays may have some advantage over surgery in certain cases The inconveniences of an operation are spared older patients Conditions such as diabetes and cardiac diseases do not preclude this type of treatment

Finally, irradiation in certain cases, may give better cosmetic results than can be obtained with surgical measures However, there are some disadvantages with the irradiation technic. With large tumors, the period of retrogression may take weeks or months Moreover, if irradiation fails, the condition of the tissues such as fibroses, etc, may make it more difficult for surgical removal and repair by plastic surgery Due to the long period of therapeutic irradiation, the patient under such treatment may be forced to withdraw prematurely, and thus interfere with the desired results

There are certain areas in which some form of surgery is more desirable than therapy with irradiation For instance, epitheliomas of the earlobe and adjacent skin, are treated much more effectively by means of surgery Then again, epitheliomas of the lower eyelid involving the conjunctiva, in my opinion, should never be treated by irradiation, but always by excision with plastic repair

Radium can be given interstitially, and this is where it has its greatest advantage for large tumors as it can be employed with either needles or seeds in the form of radium emanation ("radon") Gold

Fig 18. Same case as Fig 17 showing no recurrence in ten years

seeds are usually allowed to remain permanently *in situ*, and the platinum seeds are removable in about ten days

Further advantages of interstitial radium therapy are (1) continuous and homogenous irradiation of the tumor over a long period, irradiating the cells in all successive mitotic stages, (2) avoiding the possible development of radioresistance by interrupted irradiation, (3) avoiding the damages of irradiation to normal tissue

Some authors prefer to give interstitial treatment by means of radium needles because they are removable, but practically they have no distinct advantage over radon seeds The latter, when left in place are apt to cause a foreign body fibrosis which is harmless or may even be advantageous Needles have a tendency to be displaced, but the seeds do not Finally, the application of seeds is made very easy by means of a special instrument, and hospitalization is frequently unnecessary The patients have practically no discomfort or pain from the permanent implants

During and after the roentgen or radium treatment as well as after the surgical intervention, the skin should be treated with mild ointments Any irritating application should be avoided

The local treatment of cutaneous cancer by chemical caustics, applications of carbon dioxide snow or reducing ointments can no longer be seriously considered, since there is not sufficient destruction or control A great number of cases still remain mistreated by such manipulations today, and they represent an essential part of the cutaneous cancers which end fatally

Conclusions

1 Although there are many forms of cutaneous cancers and precanceroses with different clinical courses, each of these conditions must be considered as malignant on account of their possible change in character

2 Adequate treatment of cutaneous epitheliomatoses consists of surgical destruction or excision and irradiation with roentgen rays or radium or both combined Generally the combination of surgery and irradiation is to be recommended

3 Thorough histologic examination of the specimen is absolutely necessary in every case to determine the degree of malignancy, therapeutic procedure, and prognosis

4 Biopsy should be followed by adequate treatment as early as possible. Loss of time may lessen the patient's chances for a favorable result

5 Each case is an individual problem in itself and the therapeutic procedure must be determined accordingly

745 Fifth Ave.

GERMS IN HIS WHISKERS, BUT—

"One thought makes me look back with gratitude and love to the old family doctor," remarks Dr William Henry Welch in an interview published in the *New York Times* "The old fashioned family doctor treated people. The doctor of today treats disease The old family doctor, though he had a long beard where germs abounded and even a spotty vest, knew his patient and in many cases the patient's family and his physical peculiarities If medicine were an exact science I should say, 'Yes, the family doctor has outlived his generation' But it is not, and he has not" Which moves the editor of the *Illinois Medical Journal* to observe that those white-coated machines who look upon each patient with the cut-and-dried aloofness with which an entomologist regards a new bug or a botanist a fresh sprout are lacking in the vital spark that makes a physician a great man

The germs in the beard of the old fashioned doctor are well consigned to the limbo of forgotten things, but what needs to be raised again from the dead is the kindly, encouraging, absolutely human look on the face of the old fashioned physician that made the suffering human feel that in him lay a friend who was both willing and able to pull him through the rough places and whose presence was almost as excellent a panacea as his pills This may be a machine age, but the people who live in it, fortunately, continue to be human beings, and a certain amount of humanity is necessary in dealing with them

The old fashioned family doctor treated people The doctor of today treats disease.

THE COMPLEMENT FIXATION TEST

A Diagnostic Aid in the Control of Gonorrhea

EMILY DUNNING BARRINGER, M.D., F.A.C.S., *New York City*

No biological test is one hundred per cent infallible The Wassermann test may have its false positives, and the Widal test may not run true to form, but where would the diagnosis and treatment of syphilis be without the Wassermann or Kahn tests, and how crippled we would be if typhoid fever detection had no Widal to rely on

Gonorrhea is considered to be one of the major public health problems in the community It involves each member of the human family — man, woman, and child

The finding of the gonococcus of Neisser in the discharges has been considered the criterion of diagnosis of gonorrhea

There is a very great difference in the ease with which this diagnosis can be established in the component members of the human family

1 *In the adult male* it is relatively easy, owing to the anatomical facts that the genital organs are mainly external, and that the urethra is large. There is little trouble in obtaining positive spreads and cultures from the urethral and prostatic discharges, in fact the male posterior urethra has been described by some as an ideal culture chamber

2 *In children,* in the male the same statement holds good In little girls before puberty with an infantile uterus and immature sex organs, one is dealing practically with one large cavity—vagina plus cervix. As a rule positive spreads and cultures are not difficult to obtain in these cases

3 *In the adult female,* however the problem is totally different. Here we are dealing with a set of organs, that are essentially internal, difficult to reach, in close proximity to the peritoneum, and organs which are subject to profound physiological functions Namely, menstruation, coitus, pregnancy, and the puerperum

In the adult female there are three fairly definite clinical stages in a gonorrheal invasion of the genital tract

1 *The acute stage* Positive spreads and cultures are generally obtainable.

2 *The subacute stage* Spreads and cultures may still be positive, but are rapidly becoming doubtful If the infection improves and cleans up in this stage as many cases do, and all the clinical symptoms and spreads and cultures become negative, then you will have the ideal outcome—an early cured case

If this were all there was to adult female gonorrhea the problem would be as easy as that of the adult male and we would have few worries as to diagnosis and treatment.

3 But unfortunately we have the *chronic stage* of adult female gonorrhea to consider Here the gonococcus travelling by direct extension may have involved the depths of Bartholin or Skene's glands, the deeper layer of the cervix, the Fallopian tubes and ovaries, and finally formed perimetritic exudates

The external genital clinical picture may have become negative, the spreads and cultures may and generally do become negative, the whole picture suggests the woman is cured, and free from gonorrhea, and she is discharged as such from medical care. Yet each month she may throw off active gonococci from the deeper layers of the uterine mucosa during menstruation, and with each act of coitus she may release virulent gonococci from the depths of her Bartholin glands

As the adult female fills the role of prostitute in our society, she is the usual purveyor of gonorrhea from victim to victim The real problem of gonorrhea then, centers around the chronic stage in the adult female, with suspicious or negative clinical, and suspicious or negative bacteriological findings A convenient blanket diagnosis of "clinical gonorrhea" has been used to cover this difficult group of cases

It is only one who has had to face this problem, and been obliged to decide the destiny of these unfortunate women, who can appreciate the gravity of this problem of so-called "clinical gonorrhea" It is natural that other laboratory tests should be sought to help in solving this problem of diagnosis

In 1907 Teague and Torrey [1] separated

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26 1937

ten different strains of gonococci from different sources into three serological groups by means of the complement fixation test and concluded that a polyvalent antigen should be used if the best results were to be obtained

Schwarz and McNeil [2] in 1911, reporting on their work on a complement fixation test in the blood for gonorrhea, stated that the test was absolutely specific

Dr William H Park, Director, and Dr Anna W Williams, Assistant Director of the Research Laboratory of the Department of Health, New York City, in association with Dr R J Wilson, Director of the Bureau of Hospitals, had various studies on the gonococcus carried on In this way from about 1919, certain short research studies have been made on the female Gonorrheal Service (which later was to become the Kingston Avenue Hospital Service)—Dr Anna Williams taking the bacteriological aspect, Miss M A Wilson the serological, and Dr E D Barringer and Staff the clinical Several of these short surveys were financed by Dr Park on private grants

In 1922 before the Gynecological Section of this Society at its annual meeting, I gave a preliminary report [3] on "The Value of the Complement Fixation Test in Gonorrhea in Women," quoting a series of 256 cases which had been subjected to a simultaneous study of spreads, complement fixations, and clinical findings The conclusions of this series had been carefully checked by Park and Williams They are as follows

1 We are willing to make a definite diagnosis of gonorrhea on a ± C F G, which we consider a weakly positive reaction, as we are satisfied that a non-gonorrheic does not give a positive reaction

2 The complement fixation test in women has a distinct value, which is greatest in the chronic and subacute cases from the standpoint of diagnosis and prognosis

3 It is of less value in acute cases, from the standpoint of diagnosis, but probably equally valuable from the standpoint of prognosis

4 The subsidence of the complement fixation with the clinical symptoms is proven in this series

5 The reappearance of a high complement fixation reaction during convalescence suggests an active focus

6 A persistent negative complement fixation with positive bacteriological findings is rare, and at this date we are unable to explain it satisfactorily

7 A persistent negative complement fixation with negative clinical and bacteriological findings we believe can be interpreted as an index of the probability of a cure of gonorrhea in women

8 We suggest as a tentative and entirely arbitrary standard that, in order to pronounce a cure of gonorrhea in women, it is necessary to have these three persistent negative findings over a period of six months. We fix this arbitrary time, as we believe the cure in women is probably somewhat slower than in men

To those of us who participated in the special research, the results of this series were most hopeful and worth-while The test gave a far higher percentage of positive diagnoses in "clinical gonorrhea" than any other But there seemed a strange reluctance on the part of physicians and laboratory workers to perfect the laboratory end of the test There was a certain complacency about letting "clinical gonorrhea" cover these undiagnosed cases and the complement fixation test was considered unreliable and useless

While condemning the test it was interesting to note that clinicians and laboratory workers failed to bring forward any other test that compared in efficiency with the complement fixation as done by an expert

We determined therefore to find out why the complement fixation was considered so unreliable, and the matter was discussed with as many representative authorities as could be found The criticism of instability was very widespread, but by hunting for the reasons for this, there was a consensus of opinion as to two general faults

1 The great difficulty of getting a stable standardized antigen

2 The need of a highly trained technician who thoroughly understands the test. This test cannot be successfully carried out by a half-trained indifferent technician, such as are often found in the big laboratories where there is a mass of routine work to be turned out.

As neither of these objections seemed insurmountable we determined to repeat our former series and go over the whole ground again under ideal conditions and with the same people conducting the entire research, thereby eliminating the personal

equation This time however we wanted to do it on a big enough scale to include cultural work so that in proving the cases *not* gonorrhea, we might find out what other organisms were giving the symptoms

These were the reasons which prompted a second study of the problem of so-called "clinical gonorrhea"

We, therefore undertook a simultaneous study,[7,9] including (1) the bacteriologic findings by Dr Anna W Williams and staff, (2) the serologic findings by Dr Archibald McNeil and staff, and (3) the clinical findings by Dr E D Barringer, Director, and staff *

Two hundred cases were taken, which had been admitted to the service as gonorrhea for further diagnosis and treatment

Result of the Survey

Several general observations were made from this simultaneous clinical, bacteriologic, and serologic study of these 200 cases

1 The results of this second series of cases show that the conclusions as to the value of the complement fixation test, are practically identical with those presented on the first series quoted above

2 We believe that we have an antigen that can be standardized and made entirely practical and that this test should be used by specially trained technicians who thoroughly understand it

3 Bacteriologic examinations, especially cultures have proved that organisms other than the gonococcus may be responsible for many cases of "clinical gonorrhea"

Over a period of years there has been a large group who have contributed directly and indirectly to the working out of this test in the Research Laboratory of the Department of Health and Kingston Avenue Hospital, Department of Hospitals, New York City—William H Park, M D, Anna W Williams M D, J C Torrey, M D, Archibald McNeil, M D, M A Wilson, Annis Thomson, M D, Agnes Hamann, Mary V Forbes, Norma C Styron, Pauline Bristol, Lucy Mischelow, Edda VonBose, M D, D. F Crowley, M D, Hyman Strauss, M D, E D Barringer, M D

The results of the work of this research group in gonorrhea in the female have four times been presented to the physicians of the United States in the Scientific

TABLE I—CORRELATION OF POSITIVE, DOUBTFUL AND NEGATIVE BACTERIOLOGICAL, SEROLOGICAL, CLINICAL FINDINGS IN GONOCOCCUS ISOLATION (Research Group, Kingston Avenue Hospital)

Spread (Smear)	*Culture*	*Comp. Fix.*	*Clinical*
			POSITIVE
+	+	+ + + + + + + + + +	A. Acute cases with active inflammatory symptoms. B Subacute cases, inflammatory symptoms. C Certain chronic cases, "latent foci."
			DOUBTFUL

Exhibit of the American Medical Association, and once before the Interstate Postgraduate Association and International Assembly

Today fifteen years after my preliminary report during which time I have continuously worked on this problem I come before you again, and wish to state that I stand more firmly than ever by the conclusions of our first series I feel I should definitely speak in the first person as I do not consider it fair to involve any

*This survey and others that followed were made possible by generous funds donated by Honorable Lucius N Littauer, New York City, Mrs. Charles Day, Philadelphia, and other public spirited citizens

colleague in a statement in regard to a controversial subject which may not exactly represent the opinion of that colleague Therefore, I personally state that, from observation of many hundred additional cases on my Service in the hospital and in private work with Park, Williams, McNeil, Thomson, Hamann, and Forbes, I have come to feel that the complement fixation test, as we know it, is of surpassing value in the diagnosis, prognosis, and treatment of female gonorrhea

I am entirely aware of the fact there are other groups of research workers who feel otherwise One of the most usual remarks in regard to the accuracy of the test is "Oh yes, it is a good test if McNeil or Thomson do it," and I have heard the same of Price of London This I believe is a very important criticism No test that cannot be standardized and reproduced exactly can have a universal value We must have a test that is as accurate in San Francisco and New Orleans as it is in Boston or New York It is of very great moment then, that I can report the following corroborative findings to you Price of London working on the complement fixation test in the early years of our work, and at no time (that I know of) comparing his findings with us, published [4] in 1931 his series of 7,000 cases with substantially the same results that we had arrived at This paralleling of our work was quite coincidental

In his monograph of 1935 reporting on an improved antigen which he considers more sensitive, he further substantiates his previous claims [5] He states that he has used the test 40,000 times during the past five years

Another most heartening confirmation of our technic comes from an institution under the State Department of Health of Pennsylvania Harold Hirshland, M D and Helen C Hirshland, A B, in 1932 were so impressed with our results that they undertook a similar survey in a state institution similar to Kingston Avenue Hospital In 1936 they reported [6] a series of 227 cases (giving a total of 545 gonococcus complement fixation tests) with findings that entirely paralleled ours This was no coincidence, only faithful repetition I quote from their report

The complement fixation test employed, is the standard technic of Drs William H Park and Anna W Williams with the checked standardization of complement. The antigen employed in the gonococcus complement fixation test is the purified protein antigen of 5 Torrey strains prepared by Dr Archibald McNeil In the effort to obtain the best possible results, Dr McNeil's technic was closely followed This report contributes no modification or variation of a technic already proven satisfactory, and we are content if these results parallel the excellent results obtained by Drs Barringer, Strauss, Crowley and McNeil

Debatable Points

In order to appraise these problems, one must have an intimate understanding of the correlation of the clinical picture with the laboratory findings This intimate understanding can only come from painstaking bedside observations of large enough groups of cases over sufficiently long periods of time Thus during these many years of observation in the Kingston Avenue Hospital, we have come to consider that there is a serological curve which follows the clinical and bacteriological curves of a gonococcus invasion in the female

Thus, in the *acute stage* of gonorrhea one may expect the clinical curve at its height, fever, pain, leukocytosis, local inflammatory symptoms, probable positive spreads and cultures, with the complement fixation reaction usually negative until the third to fifth week, when it usually gradually rises

During the *subacute stage* the clinical curve is gradually coming down (in uncomplicated cases), spreads and cultures are becoming suspicious or negative, but the complement fixation is still going up or remaining high

In the *chronic state* (if progress is satisfactory) the bacteriologic findings become negative and the clinical curve and complement fixation curve subside together

In the male the serological curve is apparently somewhat different McNeil and Price both warn against an erroneous interpretation of a minus reading in the chronic stage Here with a positive spread or culture one may obtain a negative complement fixation reading This occurs occasionally in cases where massage of the prostate has been routinely used and the focus of infection changes from a closed to an open one with consequent

lack of antibody formation Price found this occurs in three per cent of the cases in a series of 200 cases

Readings of the Complement Fixation Test

There must be an understanding or agreement about these Our Research group, Price, and the Hirshlands all run lower readings than certain other workers I believe that our ± group probably covers many cases that might be rated + by others

This in turn may account for many of the "False Positives" readings complained of In my opinion these readings of "plus minus" ± and "minus trace" fit many of those borderland cases, with doubtful bacteriological and clinical findings

Another reason for "false positives" is faulty technic McNeil draws attention to the fact that "false positives" may be obtained by not adhering rigidly to the various steps in the laboratory procedure

The danger of cross fixation with the meningococcus or catarrhalis is often stressed as being a detriment to the value of the gonorrheal complement fixation test

Both McNeil and Price state there is little to fear in regard to this being a practical dilemma in the use of the test.

The effect of the vaccines on the gonorrheal complement fixation curve is generally transient, unless the case is uncured, in which case there may be a flare-up of latent symptoms

The effect of the vaccine generally disappears about six weeks after the last injections

The effect of the filtrate Corbus-Ferry on the complement fixation curve seems to be rather more tenacious McNeil is studying this group of cases with much interest.

It is important, therefore, to know whether an individual has been under vaccine or filtrate therapy in using the complement fixation curve in tests of proof of cure.

With these debatable points accentuated, and the accomplished facts of the test ignored, gonorrhea is mentioned in the medical literature of the world in a discouraging and hopeless way—always compared with syphilis which has a standardized test for diagnosis and a specific treatment It is magnificent that the medical authorities of the world have syphilis on the run, which they surely have But why allow another, even more prevalent, arch enemy to ravage us, while we are waiting to get syphilis under control?

We have a great deal more help at hand with which to fight gonorrhea than we seem willing to realize, and make practical use of If we could reduce the problem by one-quarter or one-third we could soon begin to close in on the remaining difficulties The diagnosis of gonorrhea in the female adult cannot go forward without some other tests for diagnosis than the spread and culture, and the tests for proof of cure in the female must also be based on something more comprehensive than the spread and culture

There seems to be no other test that holds out the hope of this serologic test, namely the complement fixation Why not take this test and use the parts we are sure of, and constantly and unremittingly work on the debatable details?

Let me suggest some of the practical uses of this test

It would have a great usefulness in detecting cases of gonorrhea, if required in conjunction with a bacteriological and physical examination before granting licenses to marry

Let us take a hypothetical situation We have one hundred young women between twenty-one and thirty, applying for nurse girl jobs in a hospital or orphanage, to care for children of diaper age Suppose we insist on a complement fixation test for gonorrhea Perhaps fifty per cent will show some reaction ranging from ± to 4+, suppose ten of this group give readings 2+, 3+, or 4+ These ten cases would be promptly eliminated as being probably infectious The remaining forty cases showing ± or + could be medically passed on, and kept under observation and assigned to jobs other than immediate bedside care of the helpless babies That would leave fifty young women who might be assigned to the wards Of course in this fifty there might be one or two cases of acute gonorrhea that had not developed or might never develop a complement fixation reaction, but the chances would be that they would have clinical symptoms such as discharge which could be discov-

ered in the general medical examination By such a cleavage we would have reduced the chances of a gonorrheic infecting babies from fifty to sixty per cent down to one or two per cent There is a hard business value in regard to this procedure Not long since I was called, as a medical expert, on a case where a parent was suing a hospital for damages to a little daughter, who had contracted gonorrhea while in the hospital It was proven that the night attendant, who cared for this child, was in active gonorrhea The hospital lost heavily in the verdict Consider how different the jury would have felt if it had been shown that the hospital had picked its attendants only after using every possible test to detect venereal infection

These instances cited are only two of the many practical ways in which the complement fixation test will help in the fight against gonorrhea

In closing I quote Price who has aptly put into words three thousand miles from here, the worthwhileness of this test.

The principal object of this monograph is to stimulate interest in this test and to demonstrate its reliability I hope that the results of the researches published in this paper will hasten the time when the test will be used as frequently in the diagnosis and treatment of gonorrhea as the Wassermann reaction is used in the management of syphilis When this is achieved, the diagnosis, treatment, and cure of the disease will be on a surer foundation, and the clinician will not be forced to rely, especially in the later stages of the disease on nebulous reports or on the chance discovery of the gonococcus in smears and cultures To those pathologists who still maintain that the test has no place in the diagnosis of gonorrhea, I would suggest that if they give this technique a trial their labour will not be in vain

As a class, physicians are dyed-in-the-wool sport fans They like their football, basketball, baseball, etc, and many physicians will be found in the rooting section at most any athletic event worthy of attendance, remarks the *Ohio State Medical Journal.*

Because most physicians know sports and also because they know something about the effects of physical exercise, they are in a position to speak advisedly on the health aspects of competitive athletics

Sometimes we wonder if enough physicians are taking a sincere, active interest in checking up on this situation, especially with respect to competitive athletics among grade and high school youngsters

In a recent issue of the *Illinois Medical Journal,* a Kewanee, Illinois, physician filed a written protest against the new emphasis being placed on speeding up various games, especially basketball, which is played by more youngsters in all probability than any other game. He pointed out that the speed-up which has been given to basketball will endanger the health of many adolescents, unless substitutions are made at regular intervals and more rest periods allowed

An important point has been raised. It might be advisable for county medical societies to discuss this matter with school officials and for individual physicians to advise parents of youngsters engaging in competitive athletics that some restraint should be applied, if possible.

Never let it be said that the medical profession wants the younger generation to become a society of pansies and wall-flowers, but, by the same token, it doesn't want youngsters to become chronic invalids as a result of preventable stress and strain during the important years of adolescence

PROBLEM OF PERIPHERAL VASCULAR DISEASE

ARTHUR N CURTISS, M D, *Syracuse*

The increased interest in the study of peripheral vascular disease in the past few years has resulted in the addition of much valuable information and significant advance in the treatment of this condition Many cases which were formerly discarded immediately into the hopeless group for which little could be done are now being relieved of symptoms and having their span of comfortable existence increased by the intelligent treatment of those practitioners willing to carefully study such cases The field is still in its infancy and, it is only by the exchange of data and experiences of many observers, that the most rational advances will be made This contribution is presented with the hope of focusing the attention of more physicians on the problem, and to emphasize the point that much useful information can be gained and worthwhile results obtained by very simple means

When a local condition of faulty circulation of the extremities is thought to be present, several pertinent questions immediately present themselves

Is the condition due to a disturbance of flow into the extremity (arterial) or, is it due to interference of return flow (venous or lymphatic)?

If the condition is arterial in origin, is it due to obliterative disease, or is it due to spasm?

If venous, is it due to organic change in the walls of veins, or is it due to pressure from without, obstructing flow?

If these questions can be accurately answered, considerable progress has been made. The treatment of these various conditions is fundamentally entirely different and is the basis for the statement that accurate diagnosis is the most important part of the problem of peripheral vascular disease

The differentiation of arterial and venous disorders can often be made by symptomatology and the appearance of the extremity A limb which is receiving an insufficient supply of blood due to arterial disorders usually gives the story of numbness, coldness, pain after exercise which is relieved by rest (claudication), rest pain, discoloration of dependent parts, pallor when elevated, or trophic changes of skin or nails Any combination of these may be present On inspection, the skin is thin, scaling, and wasted, the nails ridged and thickened, ulcers may be present, and there is reddish discoloration in the dependent position Arterial pulsations such as popliteal, posterior tibial, and dorsalis pedis are deficient or absent and the foot may be cold Wasting of muscles is sometimes marked

Venous disorders on the other hand usually result in a pallid swelling If a main channel is involved, such as in the pelvis, the whole extremity is involved If due to varicosities, these can be seen and swelling is confined to the parts distal to the affected veins Arterial pulsations are present unless so much swelling has occurred as to compress the arteries As the result of long-continued venous stasis, so-called stasis dermatitis may be present which may be so severe to cause death of tissue, with consequent ulceration, and there is often brownish pigmentation of the skin above the ankle The extremity is usually warm

When the decision that there is disturbance of arterial flow is made, several further questions immediately present themselves Is the disturbance due to vasospasm or to obliterative disease, and if the latter, is the condition predominantly of large or of small vessels? These questions are extremely important because choice of treatment depends on their accurate answer They can be answered by careful physical examination together with oscillometric and skin temperature determinations The oscillometric readings are a measure of blood flow in major vessels which can be graphically recorded The height of the curve depends on several factors, most important of which are elasticity of the arterial wall and amount

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

CHART I—NORMAL FLOW

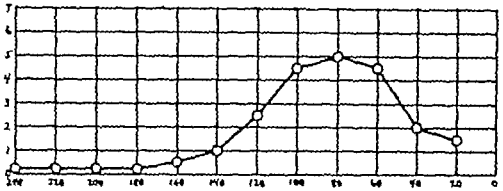

CHART II

Diminished flow in major vessels of thigh and almost total occlusion in leg Arm for comparison.

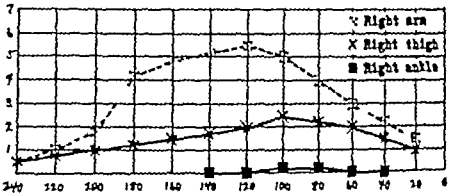

CHART III

Good flow in thigh. Diminished flow in leg

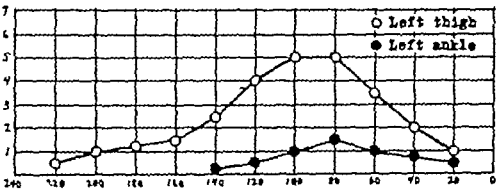

CHART IV

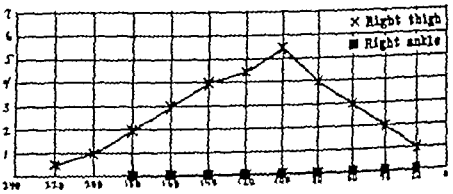
Good flow in thigh Total occlusion in leg due to embolism at popliteal bifurcation.



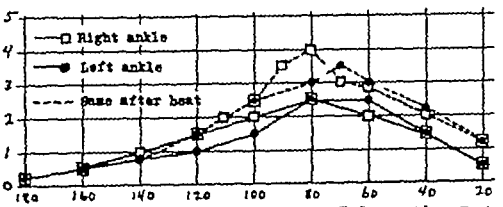


CHART V

Diminished flow due to spasm with some dilatation after heat.

Temperature Readings		Before	After Heat
	Right 1st toe	26 1°	32.0°
	Sole	26 1°	32 1°
	Left 1st toe	25 0°	32 8
	Sole	26 8°	32.5°

of blood flow through it It has definite limitations in that the ordinary apparatus can only be applied successfully as far distal as the ankle and it does not give an index of amount of collateral flow which usually does not pulsate (Charts I-V)

The skin temperature readings are an index of flow in small vessels if done under suitable conditions They should be done under constant conditions of temperature and humidity, but still are of considerable value, when a constant temperature room is not available, if done at a fairly low room temperature (20-24°C) If apparatus for measurement of skin temperature is not available, much worth-while information may be obtained by the simple observation of feeling of the foot, and noting whether it is cold or warm A cold foot means that less than the usual supply of blood is reaching the foot, and in the presence of a warm foot under the above mentioned conditions, blood flow must be fairly adequate

By combining and interpreting the oscillometric and skin temperature readings, before and after vasodilatation by heat, the question of whether the condition is spastic or obliterative and whether involvement is predominantly of large or small vessels can usually be determined Vasodilatation can be produced by immersing the opposite extremities (arms when legs are being studied) in warm water or by simply wrapping the patient in blankets for an hour When the latter is done a hot water bottle is placed at the back below the shoulders A good "sweat" is desirable When previously cold extremities become warm under these conditions, and skin temperature is increased without the application of external heat to the extremities, the increase of temperature can only come from increase of blood supply—constricted blood vessels have dilated to carry more blood to the part When a skin temperature of twenty-four or twenty-five increases to 31 5° or higher, this is indicative of release of a definite angiospasm Conversely if marked obliterative disease is present, the skin temperature fails to rise to the normal level of 31 5° (Table I)

As stated before, the oscillometric readings are a measure of blood flow in major vessels For ordinary purposes, readings are taken of the thigh and lower leg or

upper and lower arm A decrease in height of the curves is indicative of decrease in blood flow An increase in the height of the curve after heat is indicative of increase of flow in major vessels By combining the information obtained by these determinations the type of pathological physiology present can be determined and located in either small or large vessels This can best be shown by Table II

Of course, as in most fields of medicine, not every case will fall clearly into one of these arbitrary divisions and combinations of lesser and greater degrees of these various conditions are encountered However, it is usually possible by careful study to decide whether a case is predominantly spasm or obliterative disease, and whether the involvement is predominantly in large or small vessels For purposes of intelligent treatment, the above diagnosis of the pathological physiology present is more important than classification into the older stereotyped diagnoses such as Raynaud's and Buerger's disease Many of the cases of angiospasm formerly loosely called Raynaud's disease are found to be secondary to some other condition, such as nervous exhaustion, foci of infection, toxic states, etc. One case of marked angiospasm was seen in a woman who had severe thallium poisoning from a depilatory ointment, and I believe it is only fair to assume that there was a definite connection Diseased arteries are also particularly prone to spasm and many cases in which there is mild organic arterial disease show a large element of spasm In fact, the organic change may be so slight as not to produce symptoms were it not for the added factor of spasm Most of the cases of true obliterative disease fall into the three groups of senile arteriosclerosis, diabetic arteriosclerosis or thromboangiitis obliterans, but some cases of thromboangiitis seem clearly to be infectious in origin and different from the classical Buerger's disease

When the type and location of pathology has been determined as accurately as possible, successful treatment is often possible Some of the newer forms of treatment have produced spectacular results in some cases Because of this, and the attendant publicity which they have received, the tendency is on the part of some men to expect and urge that every case of vascular disease receive passive vascular exercise This can only result in discredit to this form of treatment for, if carefully studied, it would be evident that many cases are not suitable for this procedure, or should receive more benefit if treated by other means

In our series of cases less than thirty seven per cent of those studied were thought suitable for suction and pressure therapy

It should be strongly emphasized that spectacular as some of the results have been, none of the newer methods can result in miracles and that dead tissue cannot be restored In no other field in medicine is the need for early diagnosis and treatment more imperative if satisfactory results are to be attained

STATE TOWER BLDG

Discussion

DR J HERBERT CONWAY, *New York City* —In the past fifteen years the subject of therapy in peripheral vascular disease has been given much discussion A wave of conservatism has entered into the treatment advocated by internists and surgeons alike No longer is an individual who suffers from the symptoms of peripheral arterial insufficiency considered a certain candidate for radical surgical treatment Today he is subjected to the methods of improved diagnosis which have been so thoroughly outlined by Dr Curtiss These improved diagnostic measures allow for a more accurate interpretation of the impaired vascular dynamics of the extremity under consideration and allow for a more intelligent use of the many new methods of conservative therapy

It was in 1924 that Brooks[1] called attention to the use of the tourniquet test as a diagnostic measure Giving, as it does, much information on the probable rapidity of increase in the vascular efficiency of an extremity it led to a more thorough consideration of the pathologic physiology of an arterial system which had been impaired by acute or chronic disease In the execution of this test a tourniquet is applied to the thigh Temperature observations are then made over the distal portion of the extremity In the normal subject, after release of the tourniquet, there is a gradual return of the peripheral temperature to normal (Chart VI) In patients with vascular disturbances the return of the temperature to normal is less rapid In these observations subcutaneous tissue temperatures were taken with a needle style thermocouple Following the stimulating ideas of Brooks, other diagnostic and therapeutic measures made their appearance on the field of peripheral vascular therapy (Chart VII)

Conservative measures advocated in the care of patients suffering from circulatory insufficiency of the extremity include the following

I Bed Rest

II Heat

1 Vasculator
2 Diathermy
3 Warm blankets
4 Electric light
5 Infrared rays

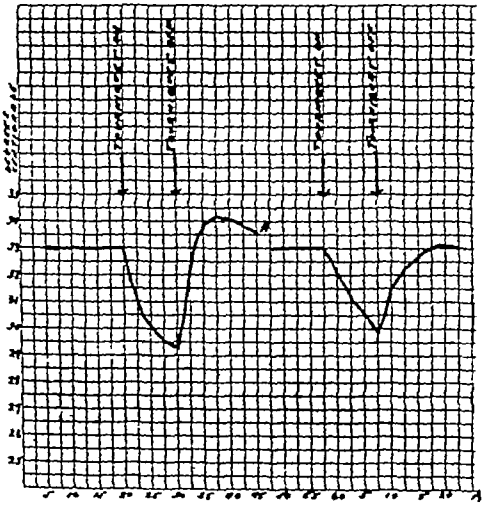
III Reduction of vasospasm and increase in vasodilatation

1 Elimination of tobacco
2 Elimination of exposure to cold
3 Elimination of ergot-containing foods
4 High calcium diet
5 Administration of parathormone
6 Administration of acetylcholine
7 Administration of pancreatic extract
8. Administration of extract of skeletal muscle
9 Administration of thyroid extract
10 Administration of theobromine
11 Iontophoresis with acetylmethylcholine
12 Administration of hot drinks
13 Administration of alcoholic beverages
14 Administration of papaverine
15 Reflex vasodilatation produced by immersion of upper extremity in hot water bath
16 Administration of typhoid vaccine

IV Methods directed at Decreasing the viscosity of the blood

1 Intravenous administration of hypertonic salt solution
2. Intravenous administration of sodium citrate solution

V Exercises



1 Active
  a Buerger-Allen exercises
2 Passive
  a. Alternate suction and pressure
  b Intermittent venous occlusion
  c. Sanders Oscillating Bed (Fig 1)

VI Surgical measures

1 Relief of Pain
  a. Peripheral nerve block
  b Peripheral nerve section
2 Alteration of circulatory balance
  a. Ligation of major vein
  b Femoral arteriectomy
3 Increase in vasodilatation
  a. Periarterial sympathectomy
  b Sympathetic ganglionectomy

The value of the simpler conservative measures such as bed rest and the application of external heat has long been known Care of the skin and nails, prevention of local trauma, and other details in the conservative management of peripheral vascular disease have been masterfully emphasized by Reid[2] The methods of application of external heat have been exploited by the manufacturers of mechanical appliances for increasing the environmental temperature in the region of the involved extremity

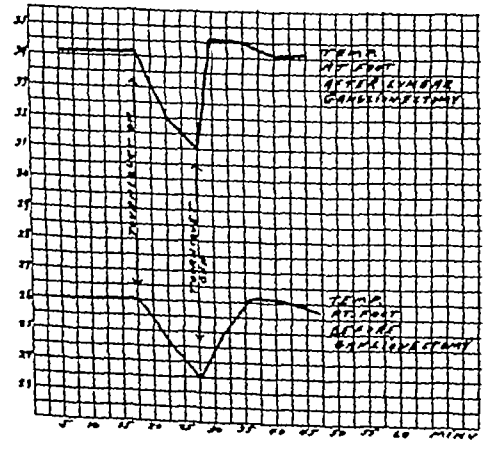


CHART VI—VARIATIONS IN NORMAL RESPONSE TO TOURNIQUET TEST

(A) Tourniquet applied with subject prone and after elevation of leg for two minutes
(B) Without elevation of leg Veins engorged while tourniquet was in place.

The general measures advocated to reduce vasospasm and increase vasodilatation have included the elimination of certain toxic substances which have been shown to produce constriction of the arteriolar bed. Silbert,[2] Lampson,[4] and others have called attention to the importance of tobacco in producing vasospasm Kaunitz[5] (1923) described chronic endemic ergotism and recommended that such ergot-containing foods as rye bread and pumpernickle be eliminated from the diet of patients with arterial disease Bernheim[6] advocated calcium therapy and the administration of parathormone for the relief of vasospasm

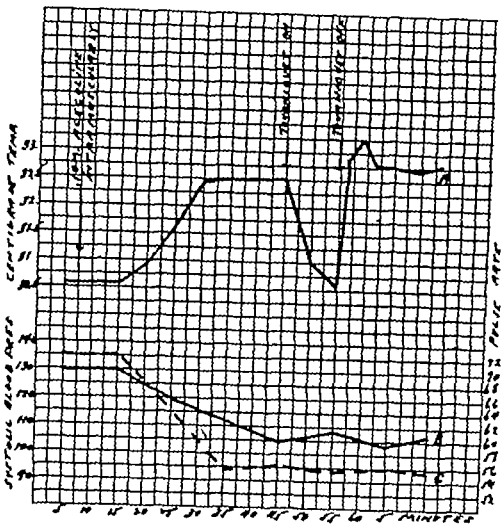

CHART VII—RESPONSE TO TOURNIQUET TEST BEFORE AND AFTER LUMBAR GANGLIONECTOMY

Acetylcholine was advanced as a powerful vasodilator by the French investigators, Villaret and Justin-Besancon,[7] Barker, Brown, and Roth[8] reported improvement in a group of patients with thromboangiitis obliterans and arteriosclerosis following intramuscular injections of three c.c of a nontoxic pancreatic tissue extract. Similar results were obtained in cases of thromboangiitis obliterans after the intramuscular administration of myoston, an extract of skeletal muscle Thyroid extract has been given for the purpose of increasing blood pressure and flow of blood by Silbert and Friedlander[9] Medical measures directed at increasing vasodilatation include the administration of theobromin-sodioacetate as advocated by Scupham[10] In thromboangiitis obliterans definite success has been reported Kovacs, Saylor, and Wright[11] have reported a series of cases treated with acetylbeta-methylcholin chloride administered by iontophoresis This method, according to these investigators, is particularly valuable in accelerating the healing of chronic leg ulcers due to impairment of venous circulation The value of the administration of hot drinks and alcoholic beverages has long been known Papaverin has been heralded as a strong peripheral vasodilator and also as an algesic. Landis[12] has practiced the immersion of one extremity in a hot water bath in order to promote vasodilatation of another extremity while mechanical treatment is in process Typhoid vaccine and other forms of protein[13] have been given intravenously to produce febrile reaction with its accompanying vasodilatation Of these medical measures, I have had convincing experience with acetylcholine and with papaverin That acetylcholine hydrochloride (acecoline)* produces vasodilatation is evidenced by the fact that the tourniquet test shows a temperature response after administration of the drug which is similar to that obtained after interruption of the vasoconstrictor nerve fibers by lumbar ganglionectomy The return to normal of the surface temperature after release of the tourniquet is equally rapid after administration of acetylcholine and after lumbar ganglionectomy The toxic effect of this drug, however, even when administered intramuscularly in doses of only 1 Gm is shown in its effect on the blood pressure and pulse rate Jackson[14] came to the conclusion, after animal experimentation, that acetylcholine when given in doses sufficient to cause peripheral vasodilatation is too toxic for ordinary use I have used the drug perparin, a synthetic, non-habit forming compound which is said to be chemically

Effect of acetylcholine on (A) temperature right foot, (B) systolic blood pressure, (C) pulse rate.

identical with papaverin and have found it valuable as an analgesic in cases of advanced peripheral arteriosclerosis, but have observed no definite evidence of its vasodilating power (Chart VIII)

Methods of therapy directed toward decreasing the viscosity of the blood include the venoclysis of hypertonic saline (three or five per cent solution) based upon the original investigations of Mayesiama[15] and of Koga[16] Recently Silbert[17] and also Samuels[18,19] have reported excellent results in the treatment of thromboangiitis by this method Bernheim and London[20] have tabulated case records giving their results in thromboangiitis obliterans and in arteriosclerosis following the daily administration of 250 c c of two per cent sodium citrate solution Of ninety-nine cases of arteriosclerosis 83 8 per cent showed improvement. Of fifty-four cases of thromboangiitis obliterans 79 6 per cent showed improvement. These authors have emphasized the similarity of the two disease groups in their therapeutic response.

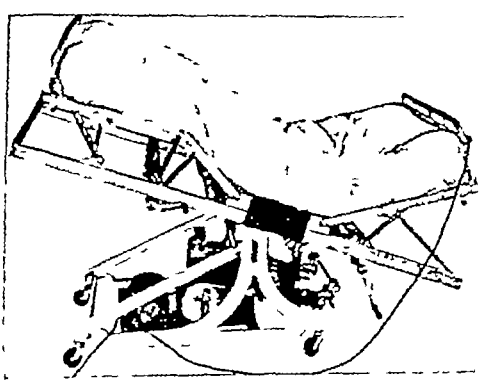

Fig 1 Sanders Motorized Oscillating bed Adjustable back rest and knee rest make for comfort as bed alternately lowers and elevates the head end and the foot.

Exercises, the technic of which was worked out by Buerger[21] and by Allen[22] were considered a most valuable aid to a feeble local circulation Recent objections to this type of exercise have been based on the fact that the voluntary effort on the part of the individual, at the time that the feet were put through the proposed exercises, created an increased peripheral demand for volume flow of blood It was in 1933 that passive vascular exercise[23,24] also referred to as alternate suction and pressure therapy, was made available through the use of machines which, by producing rhythmic changes in the environmental pressure of the extremity could effect a rhythmic increase in the flow of blood through it Such exercises, in contrast to the active exercises introduced by Buerger and Allen have been referred to as passive vascular exercises My experience to date has supported my opinion advanced in a publication in 1936[25] Over a period of two and one-half years, seventy-two cases have been followed closely and have been given a total of 7,854 hours of treatment using the Pavaex machine designed by Herrmann[26] The cases of arteriosclerosis under treatment have been those in which clinical and x-ray examination showed that the impairment was chiefly of the major arterial tree These cases have been classified after careful diagnostic study including x-rays of the feet, determination of the occlusion index by peripheral nerve block with novocain, and oscillometric examination (Table III)

In these cases 67 3 per cent showed marked improvement while 9 1 per cent came to radical amputation This treatment has its chief value, in my opinion in the cases of sudden vascular occlusion Of seventeen cases only two came to major amputation In no case was major amputation indicated if alternate suction and pressure therapy was instituted within six hours after the occurrence of the occlusion (Table IV)

It was in 1936 that Collens and Wilensky[27] described an apparatus which gave intermittent venous compression Based on the evidence presented by the studies of Lewis and Grant[28] to show that alternating venous occlusion and release results in an increase in circulation to an extremity the apparatus was designed to produce rhythmic restriction of the venous blood returning from the extremity The originators report that its use in the treatment of organic peripheral

vascular obstruction is followed by relief from pain, increase in surface temperature, increased walking efficiency, increased vascularity permitting amputation at lower levels, and healing of chronic ulcers I have had no experience in the use of this new form of treatment

In the same year (1936) Sanders[29] described a motorized oscillating bed, used at first in the treatment of cardiac disorders (Fig 1) Its application to the treatment of peripheral vascular disease was immediately recognized This unit consists of a motorized hospital bed with two speeds which alternately elevate and lower the head and the foot. The amplitude and rate of oscillation are adustable in a simple manner Three and one-half minutes is required for one complete cycle from low to high point and return The motor is quiet and not disturbing to the patients or to hospital routine My experience with this unit is very limited but sufficient to allow the statement that it is of particular value in affording relief from rest pain As a therapeutic adjunct, its use seems theoretically sound since gravity is the strongest agent used to stimulate the circulation It is a form of passive vascular exercise which does not carry with it the possibility of trauma to the vascular bed of the extremity It is my opinion that to adequately aid the development of collateral circulation in an extremity the patient should be kept on the oscillating bed for at least twelve hours a day

The many minor surgical measures advocated for the relief of pain are, of course, indicated in some cases With their judicious use, it is no longer necessary to amputate because of excruciating pain. It is not within the scope of this discussion to take up the indications for the various operative procedures

In summary it is emphasized that the conservative management of peripheral vascular disease in conjunction with minor surgical measures for the relief of pain is attended with gratifying results whether the therapy be directed at decreasing the viscosity of the blood or increasing vasodilatation by mechanical means

DR. HERMAN E PEARSE, JR., *Rochester*—It is gratifying to have had Dr Curtiss stress the necessity of evaluating peripheral circulatory deficiency in terms of pathological physiology for only by such diagnostic efforts may we treat the condition intelligently The greatest advance in this field has been the clear recognition and differentiation of the parts played by occlusion and spasm in the production of peripheral ischemia The occlusion may be gradual as with endarteritis or abrupt as in ligation thrombosis or embolism, but however it occurs, an organic obstruction exists that is apt to require mechanical means for its

TABLE IV—SUDDEN VASCULAR OCCLUSIONS RESULT OF TREATMENT WITH ALTERNATE SUCTION AND PRESSURE

correction Fortunately surgical and instrumental means have been devised for this which, though far from perfect, have given us a method of attack

Even greater progress has been made in the recognition, evaluation, and treatment of the spastic element in peripheral arterial disturbances Raynaud's disease has long been known as a clear-cut example of this but now we recognize that in psychic states, neurological disorders, post-traumatic lesions, glandular deficiencies, embolism or even Buerger's disease and arteriosclerosis, vasospasm may play a part in the picture. How much it influences the process may be judged by well-defined tests Dr Curtiss has mentioned two of these, the use of the oscillometer and heating the body to produce vasodilatation The same result is obtained by blocking with novocain the sympathetic vasoconstrictor fibers in the peripheral nerves by the method of Morton and Scott or White. By any of these means, the capacity of the vessels for vasodilatation may be accurately determined and so the amount of the spasm defined It may ordinarily be combatted by the use of heat, vasodilating drugs or operation on the sympathetic nerves

The progress that has been made to date is in all probability only a beginning Many problems still exist both in the pathological physiology of vascular derangement and its treatment

---

RAPID CHEMICAL BREATH TEST FOR INTOXICATION

R N Harger, E B Lamb and H R. Hulpieu, Indianapolis (*Journal A M A* March 12, 1938), state that none of the existing tests for alcoholic intoxication can be performed at the scene of the accident or in most local police stations, which means that the subject may be detained for hours or even days until the analyst's report is available They have developed a procedure with the objects of eliminating or minimizing these difficulties

As a result of rather extensive experiments, they have developed a reagent for alcohol This reagent consists of a weak solution of potassium permanganate in the presence of aproximately fifty-five per cent sulfuric acid by weight. When air or breath is passed through this solution any alcohol present will be absorbed and the absorbed alcohol will react rapidly and quantitatively with the permanganate

This reaction will take place at ordinary temperatures and does not require the application of heat The change in color is a decisive one, which is marked by the disappearance of the initial purple and the formation of a very faint yellowish brown. The reagent is not affected by acetone. Other alcohols and ether will also reduce permanganate under the condition employed, but these substances would hardly be present in the body of an automobile driver, or if they were present, they would be included in the substances which are banned by the driving laws of most states The decisive change in color of the reagent may have a marked psychic effect on the subject being tested and has frequently enabled the authors to secure truthful statements from alcoholic subjects who at first denied drinking

The behavior of the reagent is easily demonstrated in court The breath odors resulting from the consumption of onions, garlic, sen-sen and cloves do not affect the reagent, and tests conducted on more than 1,000 normal and hospitalized subjects failed to reveal the presence of any substance in the breath of these nonalcoholic people that was capable of reducing the permanganate reagent The ratio of alcohol to carbon dioxide in the breath may be used to measure the concentration of alcohol in the blood The weight of the alcohol accompanying 190 mg of carbon dioxide in the breath is very nearly equal to the weight of the alcohol in one c c. of the subject's blood.

Employment of the ratio of alcohol to carbon dioxide in the breath permits the test to be done without the subject being touched A tube is held in the breath stream and a pump draws the sample through the apparatus Tests made on 121 subjects showed a good correlation between the concentration of alcohol in the blood and the amount of alcohol accompanying 190 mg of carbon dioxide in the breath The method will probably not predict the concentration of alcohol in the brain quite as closely as analysis of blood, but the authors believe that the results are amply accurate for practical purposes In addition to being used in medicolegal cases, it may aid, when the pump is used, in differentiating alcoholic coma due to other causes

It is emphasized that chemical tests for intoxication should not exclude evidence such as observations of eyewitnesses and physical tests but that chemical tests will give additional information, which is often sorely needed Such tests will exonerate the nondrinker and even the mild drinker, and they will show the concentration of alcohol in the drinker's brain

INHALATION AND PNEUMATIC TREATMENTS

Moses Weiss, M D, *New York City*

The State of New York established an inhalatorium at the new reservation in Saratoga Springs Since then another was recently established in Lakewood, N J These institutions are conducted along the same lines as those in European spas and health resorts

The purpose of this article is to acquaint one with this form of therapy, its indications and applications Inhalation is the administration of vaporized and nebulized salts, mineral waters, oils and medications via the air passages [1] This form of therapy has long been in use It has had its enthusiasts and skeptics just as any other form of treatment Galen recommended a stay near the seashore for tuberculous diseases where the naturally vaporized sea salts could be inhaled In the last two or three decades a great deal of research work has been done in this field and today its therapeutic value is recognized for treating respiratory disorders

In 1849 Auphan established the first inhalatorium in Auzet-Les-Bains, France The indications and technic were fundamentally described by Sales-Giron He pulverized different mineral waters which the patients inhaled He observed that the evaporized substances retained their original pharmacodynamic reaction Automatically the question arose as to whether these pulverized substances penetrated— 1 If so, how far? 2 To what degree must these substances be pulverized in order to penetrate? 3 How much of the pulverized medication is absorbed?

Diverse experiments in the latter part of the last century were carried out by inhaling pulverized dye The results were negative and they were unable to prove that the particles penetrated the bronchi and alveoli The failure of these experiments were discouraging because the dye was deposited on the mucosa of the nose being unable to reach the deeper respiratory tracts Further observations, nevertheless, proved that the reason the dye settled in the nasal region was that the animals could breathe only through the nose and because the dye was insufficiently pulverized But the mere fact that miners who inhaled dust and various small particles had developed pneumoconiosis, encouraged further investigations [2]

Experiments on rabbits by permitting them to breathe a medication called glycerinan (a mixture of glycerine and suprarenin) revealed under microscopic examination that drops of glycerine were deposited in the alveoli and in the interstitial tissue It was soon recognized that the degree of inhalation depended upon the size of the particle, i e, to what size must these particles be reduced in order to reach the deeper lung recesses

Heubner and his scholars[3] (1925, Klin Woch) developed the theoretical and practical basis of inhalation They found that, in judging the value of a modern inhalation apparatus, one had to consider the volume and bulk of the spray and also the degree of spraying pressure The volume plus the spray's diameter was called the "spray dose" In other words, the "spray dose" was the amount of medication used As to how much was absorbed, Huckel and Kipper (Zetisch & F D, Phys Ther 1925), employing iodide solution and other medications, compared the amount inhaled and exhaled, and discovered that fifty per cent of the aerified and brined medications was absorbed Schaffer, by means of an electrical filter, checked the amount of medicated vapor inhaled and exhaled to determine the exact amount absorbed in the respiratory tract and obtained similar results

Technic

Levine constructed (1882) an inhalation apparatus which was later used as a prototype for improved models The medications mixed with vaporized water were conducted through a glass tube thus enabling the patient to inhale the vaporized remedy This very simple form of inhalation was gradually improved upon until the present-day apparatus was evolved

In all modernly equipped inhalatoriums, there are two types of apparatus in use— (1) the Brine Disperser (Sol-Zersteuber

or Wet Inhalation used for various mineral water and salts) and (2) the Dry Nebulizer or Aerifier, used for various medications

1 The construction of the Brine Disperser is based on the Bergson principle, using two pencil-shaped pipes which narrow to an opening even as small as one sixty-fourth of an inch in diameter They are placed in a horizontal and vertical position so that the tip of one pipe is very close to that of the other, The vertical pipe is connected to the mineral waters, oil or medications Fifteen or thirty pounds of compressed air is forced through the horizontal pipe, which pressure sucks the mineral or medication from the vertical pipe and transforms it into a brine

2 Dry inhalation is based on the principle of the Spiess tube which is inserted into a small bottle The tube has two to four small holes through which the compressed air throws the medication against the wall of the bottle thus dispersing and aerifying it

Reactions, Indications, and Medications

The reaction is chemical and physical, the latter substantially supports the former Not only is the effect of the medication used important, but also the degree of humidity, temperature, and compressed air It is indicated in all forms of respiratory disorders such as rhinitis, hay-fever, sinusitis, laryngitis, pharyngitis, tonsillitis, all forms of bronchitis, bronchiectasis, emphysema, asthma, etc [4,5] The medications used as inhalants are classified according to their action [6]

1 Soothing reaction In this category belong the oils, glycerines, and other aromatic substances which, when mixed with water and inhaled, reduce the irritation of the mucosa, especially in the upper respiratory passages, so that the pain sensation will disappear They are indicated in acute or chronic catarrh of the upper respiratory passages, i e. rhinitis, laryngitis, tonsillitis, pharyngitis, tracheitis The reaction increases when different herbs (Flor Malv Herba Pulmonary, etc or Ol Amydal or olive-oil) are added to the vapor

2 Mucus-dissolving medications (resolvents) In this group belong the 0 2-0 5 per cent solution of table salt, different mineral waters as used in Reichenhall, Baden, Bad Ems, Saratoga Geyser, i e., any alkaline water containing principally the double carbonic acids of sodium or carbonic acid of potassium The use of chloride of ammonium has been recommended by Waldenburg for catarrh of the upper respiratory passages with expectoration difficulties A certain amount of care is necessary when applying chloride of ammonium because of the ammonium content which may have an irritating reaction Trendelenburg recommends the inhalation of chloride of ammonium even in bronchial asthma, emphasizing the fact that ammonium has a relaxing effect upon the bronchial muscles. As a special resolvent, calcium is used in different combinations such as aqua calcus, hydrochloric acid of calcium or milk acid of calcium The vapor of calcium water dissolves the fibrous mucous

3 Astringents They are particularly indicated in catarrahs producing a high hyperemic and strong secretive reaction as in fetid or chronic bronchitis, bronchiectasis, etc Muszkat recommends a tannic solution (.2–3%) in a mixture of glycerine (tannic acid 1 0, glycerine 40 0, aqua dest 0 60 or alum solution from 1–4%) In this group also belong the etheric oils (turpentine oil and pine oil), inasmuch as they reduce the secretion and act as a disinfectant [7]

4 Medications with disinfecting reactions Kopf recommends the inhalation of air conducted through hydrochloric acid. A Hartmann, when inquiring about the health of workers in various factories, where different acids are inhaled, found that tuberculosis, influenza, and other respiratory infections were very rare [8] Acids can be inhaled in different combinations It is mainly applied in the room inhalatorium Formic acid, hydrochloric acid and chloric gas is used for this purpose In the antiseptic group belongs menthol in two per cent form or menthol in alcoholic solution Muszkat recommends the use of 500 c.c. mineral water, four-five drops of ten per cent menthol alcohol solution by 30 C, and also menthol turiopin

5 Anesthetics—Cocaine, novocain, alypin, etc They are generally applied by the Spiess-Drager Atomizer and Hirth Inhalator 2 per cent cocaine is applied as anesthetic to reduce the coughing spells It produces an anemic condition of the mucosa and relaxes the spasms of the bronchial muscles

The effect of the medication may be local and absorbing Wherever the medication reaches, it mixes with the pathological secretions and has a dissolving, disinfecting, soothing, etc. effect [9] It has a tonic effect upon the mucous membrane, congestiments of the mucous

membrane diminish, the mucous becomes more liquid, and can be expectorated Thus the medication has a more penetrating effect.

Aside from the local effect, it has a great absorbing value, especially after the mucus is expectorated from the bronchi and alveoli The inhaled amount of spray and penetration degree, depends completely upon the nature of the sprayed gas or vapor The nebulized substance of the medication will be able to penetrate as far as the bronchi and alveoli It has been proven that physiologically when coming in contact with the capillary of the lung, the medication will be absorbed in the same manner as it would be if administered by injection

The physical or hydriatic reaction is divided into thermal and mechanical

Thermal reacts according to temperature Cold inhalation has a tonic effect plus relief from pain Warm inhalation creates an active hyperemia and weakens the effect of infectious germs and toxic substances Alternating hot and cold applications are recommended as stimulants

Mechanical The inhalation spray through the force of the compressed air, hits the wall of the air passage and is great enough to act as a vibration massage and simply to wash away sticky pathological products The different mineral waters and salts are principally used as physical intermediaries both mechanical and physical effects are more pronounced by treatment of upper respiratory organs—rhinitis, tonsillitis, pharyngitis, laryngitis, and bronchitis

Differential Pressure Respiration

Pneumatic treatment is divided as follows

1 Underpressure respiration This consists of inhalation and exhalation of air below atmospheric pressure This process of respiration obviously results in a difference between the atmospheric pressure (760 mm Hg) of the body surface, and the vessel's pressure below atmospheric pressure which is generated by inhaling rarified air (under 760 mm Hg) in the thorax, i e, mainly in the lungs This difference in pressure is the actual principle of the therapy The following physiological reaction upon the heart will occur when rarified air is inhaled According to tests by Dr O Bruns, the venous blood is drawn from the periphery and abdomen towards the lungs In other words, the blood flows naturally from the local of high pressure towards the local of low pressure.[10] The results declare themselves in expansion of the ducts in the pulmonary circulation on the right side The diastolic output is increased. The minute volume is augmented Therefore, respiratory diseases producing secondary heart ailments by impeded pulmonary circulation and also primary heart disease such as shown in certain forms of myocarditis, produces an exercising therapy for the heart muscles during the period of balanced compensation [11] Changes of the myocardium produced by arteriosclerosis are favorably influenced by this form of therapy because the increased pulmonic circulation tends to improve the nutritional state of the heart muscles through the quickening of the venous circulation in general

As far as the physiological reaction upon the lungs is concerned, the inspiration is rendered more laborious and the expiration easier, thus evincing a sort of respiratory gymnastic which in certain diseases of the respiratory organs are accompanied by most beneficial results, i e., in bronchial and cardial asthma [12] The patient is forced to inhale more slowly and more calmly, he does not take in more air than is required for meeting the deficit of oxygen and so prevents inflation of the lungs (emphysema) The amount of inflated air retained in the alveoli after an attack of asthma, is drawn off again by the force of the suction From a therapeutic standpoint therefore, the suction effect will be beneficial in emphysematous conditions [13]

The underpressure also has a very interesting reaction upon the bone-marrow, it reacts as a stimulant on the same principle as altitude, i e, increase of the regeneration of red blood corpuscles [14] In other words, it indirectly improves anemic conditions

Mode of Application The best procedure is the so-called "creeping method" Starting with a vacuum underpressure of five cm water column for two minutes only After an interval of five minutes, another two minute period of underpressure breathing, which is repeated once more, in other words, three two-minute period lung exercises with five minute intervals between each period This is the dosage for the first session In the course of the treatment, the water column is increased on the third day from two to three cm , from then on, every third day up to the maximum of twenty cm with gradual extension of the inhalation to ten, twenty, and thirty minutes With each session the underpressure must be increased to maximum very slowly and decreased just as slowly to minimum

2 Overpressure respiration This consists of inhalation and exhalation of air above

atmospheric pressure (760 mm Hg) The frequency of respiration is diminished as the vital capacity is raised [15] The expiration is rendered more difficult and the inspiration on the contrary is eased Overpressure is used in asthmatic cases, chronic bronchitis, where dyspnea is present and also where abundant expectoration of mucus is desired.

3 Combination of over- and underpressure respiration The efficiency of overpressure is more beneficial when employed in combination with underpressure. As a thoracic exercise, we have the patient exhale with underpressure and inhale with overpressure

Value of pneumotherapy in respiratory disorders

Ortel and Knanthe summarized the reaction of under- and overpressure upon the mechanism in the following manner

UNDERPRESSURE

a The expiration is more pronounced with the help of vacuum as compared with normal atmospheric pressure

b Increase of the ventilation of the lungs through promoted air exchange.

c Augmented retraction of the lungs

d Support of the expiration muscles in their function, therefore indirectly aiding exhalation

e Elevation of the vital capacity

f Increase of the pneumatometric value

The therapeutic effect expresses itself in (1) antidyspneic reaction and (2) increased expectoration

OVERPRESSURE

a Inspiration is promoted

b Extension of the lungs and thorax

c Augmented retraction of the lungs

d Elevation of the vital capacity According to Waldenburg, Grummach, and Biedert By inhaling 1/100 atmosphere above normal (760 mm Hg), lung capacity increases by twelve per cent By inhaling 1/70 atmosphere above normal lung capacity increases twenty-three per cent. By inhaling 1/50 atmosphere above normal lung capacity increases thirty-five per cent.

e Increase of the pneumotometric value.

The therapy is based upon these physiological reactions The effect will pronounce itself in (1) Antidyspneic reaction through better ventilation and promoted air exchange (2) Inasmuch as the forced air penetrates in the deeper parts of the lungs, its effect will be greater

The prophylactic application of differential pressure respiration merits particular attention as a hygienic measure in all industrial enterprises where workmen are exposed to the danger of acquiring chronic infections of the respiratory organs, i e, chronic bronchitis, asthma, emphysema, and particularly pneumoconiosis (dust in the lungs) This category comprises miners, tunnel workers, glass-blowers, and factory workers, where dust from coal, stone, wool, metal, and glass are being continually inhaled [16]

Preventive Medicine

The Basic Health Record

C Ward Crampton, M D, *New York City*

The principle of the Basic Health Record is becoming increasingly recognized in medicine and public and private and in the many fields of welfare or social health activities

To the practicing physician the matter is of vital interest. It may be a factor in keeping the patient attached to his personal medical advisor, in keeping the family doctor the center of medical care and service, making personal preventive medicine a more practical program and developing a life long continuity of health care of greater value to the patient and of increasing advance in medical science

Definition

This is a health record to be kept by the person himself It is his own personal property, and has a variety of uses and functions which will be considered in brief

Historical

The Basic Health Record was perhaps first proposed by the writer in a report as chairman of the Committee on Preventive Medicine of the Medical Society of the County of New York It is not new Health records, health books, examination records have been made and given to the examinee for many years A twelve page Health Book and Diary was given regularly to each "client" of the Health Service Clinic of the Post-Graduate Medical School, beginning in 1926 The writer has such a pamphlet record of his own "physical" examination given in the Harlem Y M C.A. forty-five years ago It consisted, however, largely of physical measurements rather than health record and guidance.

The emphasis of medicine, private and social, has turned toward the observation and recording of data, directly useful in health and illness to the examinee client and to his advisors

It is our purpose to discuss the Basic Health Record and some of its values so that it may perhaps commend itself in principle and practice to those who seek new ways to the healing of the nations and alike to those who would preserve the ancient landmarks

Method of Attack of the Problem

The best field to open the campaign is where there is greatest prospective service This is in childhood and adolescence A child is likely to be examined by several social agencies and city departments with imperfect coordination of method and result, to say the least In our 1934 report we state

> We recommend that instead of health examinations being in schools, gymnasiums, for the Boy Scouts, the Girl Scouts and for camps, etc., there be one especially careful health examination given in the physician's office to serve the basic purposes of all health and social agencies Let these essentials be attended to with utmost thoroughness and completeness and let all special needs for special examinations on the part of social and health agencies be added by them at their own discretion. This basic examination should be given in the family physician's own office. This method will increase efficiency, centralize responsibility, extend service, reduce waste and will encourage the physician who makes the examination to special thoroughness, for his findings will be under constant review by his colleagues and of service to them.

Several conferences on the Basic Record have been held. The matter was thoroughly stated in the agenda for a meeting held on April 21, 1938, in New York City, of representatives of the Medical Society of the State of New York, the Medical Society of the County of New York, health, education and welfare departments of the City of New York and various social agencies

Definition

It is (1) a personal health record (2) primarily of health matters, made with discretion (3) to be the personal property of the person, himself

Other names include "Health Passport," "Passport of Health," "Health Record," "Progress and Achievement Record" (P A R.), "Personal Health Record" and

"Health Guide." The term Health Passport was brought forward by Dwight Anderson of the Medical Society of the State of New York It gives a special point and value to the record.

Prototypes (1) Progress and Achievement Record of the National Boy Scouts (2) Health Survey, Post-Graduate Hospital of Columbia University (3) Y M C.A (4) School and college records

Content of Record

There are two classes of elements in this record—(1) fundamental and (2) accessory

1 Fundamental This record has a central basic element of simple standard observations agreed upon generally as fundamental, something like the present New York City Board of Health Record, admittedly and advisably incomplete for three reasons

(a) Any agreement on "complete" records must be a compromise.

(b) No record can be "complete" anyhow

(c) A record of this kind should omit certain data, and should be generally understood to do so

This record provides for *immediate use* and for *successive* examinations

Immediate use It will be of immediate use to others than the initial examining physician, i e, (1) other physicians making examinations for illness or health or treatment or certification, (2) other organizations or persons interested in the health status or welfare of the individual and to whom the individual wishes to present his record, (3) the individual, himself, for his own guidance.

Succeeding examinations of the fundamental basic health are notations in the nature of a vise by other examiners following closely the original examination and giving any addition or correction, follow-up, treatment and result.

Successive, or periodic, records follow the initial examination, keeping on from year to year, making the Basic Record progress toward being a simple kind of life record.

It must be remembered that this basic record will serve in many useful ways This record differs from all other medical records made and kept by physicians, boards of health, settlements, etc., because it goes to the person—it is his *personal property*, his health record and health guide through life. This record will not supplant any other record now kept by physicians or human service organizations It is designed to help, not to substitute

All of this has to do with concentration upon a few exceedingly important essentials In addition, there are other considerations, accessory records as follows

2 Accessory records in addition to the basic series (1) Data in special fields related to health and welfare, such as examination for athletic ability, anthropological records, psychometric records for various purposes, intelligence quotients, etc., nutrition status, posture, etc, etc.

(2) Records of illnesses and operations and clinical data of sorts

(3) Records of own conclusions reached by own experience in health care

(4) Achievement records, such as athletics, etc.

(5) Records of prescriptions, such as diets, eye glasses, possibly medical prescriptions, possibly not

Method of Employment

The child comes to the physician's office for a general examination The doctor makes his examination, makes his own record and fills out the Basic Record. It is given to the child or parent

The child now comes to the school examination He shows this record. The physician takes note of the data. He sees what the former doctor has seen, what he thinks and what he recommended. He goes ahead, however, making his own examination and making his own record, recommendations and conclusions, for he has complete responsibility for his own examination and can not shift that responsibility to any previous examiner He profits, however, by the previous examination, little or much He should make a record of his own examination brief, definite and appropriate on a second sheet provided for this purpose in the Health Passport. Perhaps some examiners will accept the previous examination in part or *in toto* thus a saving of a whole examination will be made. Perhaps some examiners will add data, others will not.

The child now applies for admission to a summer camp and is examined by the physician. This physician takes note of the first examination and the second examination and proceeds to make as thorough an examination as he wishes in his own way, preserving his own professional methods, as-

suming his own responsibility and in no way shifting his responsibility to previous examiners He keeps his own record, makes his own recommendations and similarly records the fact of his examinations and any findings he wishes to record under the Board of Health Record on the second page.

Similarly the boy may wish to go to a swimming pool or a Boy Scout troop, places where there may be no examination instituted, though still a need, or places where there is an excellent examination but still an appreciation of the efforts of the three preceding physicians' work

During all this time the Health Record and Guide remains in the custody of the examinee. Should the child get sick and call in his family doctor, who made the original examination he can read the observations made by three or more other physicians on the handling of his patient or health client.

He will see something of the circumstances to which the child has been exposed and gain as much as conditions, the interest, good will, etc., of the other physicians have provided for him. Maybe he will profit in his care of the case, maybe not. Little or much may be gained, nothing is lost.

Should the child however, get sick when away on a visit and a new doctor is called in he unquestionably can read the Health Passport Record with profit and rejoicing This, he might feel, is the beginning of a real cooperation and helpfulness in medicine. This may open wide fields of better understanding of the conditions which result in an illness, conditions half record, half guessed or hitherto wholly unknown

The child now returns home after the illness in the country and he is re-examined by his own friendly family physician He has the notation made by the out of town doctor He understands what happened and can go ahead more intelligently in the care of his case. Perhaps it might have been that the country doctor, confronted with a dangerous situation, considering operation and noting the name of the family physician on the Personal Health Passport, could immediately confer by telephone or otherwise with the family doctor and avail himself to the fullest of the interest and understanding of the family physician and proceed accordingly to the fullest benefit of his patient, supported and safeguarded and directed by the time ripened wisdom by the family doctor Perhaps the child becomes the subject of some special examination in relation to truancy, delinquency, work papers

The picture develops as time goes on The family doctor makes a second complete basic examination, recording anew the basic factors on a sheet identical with the first and plainly marked in the upper right hand corner Number II, Date and Age This second examination makes a high land mark or mile stone along the path of life It indicates the success or relative failure in the battle between vitality and strain, it records the unfolding of development, increase in weight, height, strength, the impact of new elements of importance, it gives a sense of direction in the life pathway It gives opportunity to follow up advice given in health habits or correction of defects, to reappoint and re-enforce health instruction It will also help the physicians in his thinking along the lines of life care, life management of whole lives

For many, this will be the first time they have been able to feel a sense of responsibility for whole lives beyond the emergency of a single illness For many, it will be a welcome opportunity to develop their interests and faculties along the line of whole life considerations For the medical profession it will be the beginning of an opportunity for acquiring a body of knowledge of the influence of one year upon the next, of one decade upon the succeeding ten year, twenty year, thirty year periods, an interesting opportunity for mankind to know more about the whole lives and their whole management, support and enrichment. In short, the Basic Record is an opportunity to begin in a very simple way the highly desirable life record

There are, of course, other forms of life record which the scientific physician, anthropologist, public health specialist, psychiatrist and social minded persons would desire and if fate is kind, they may get these excellent things But the Basic Record is not all these things at once. If it tries to be any one of them it will fail It must be preserved against the possibilities of its own higher usefulness Every scientific specialist will be a friend of the Basic Record and every scientific specialist will be its enemy insofar as he wishes to swerve its method from simplicity or to change its purpose from the simple life management function

which it can swerve in the hands of the examinee. Any specialist may, of course, add what he pleases We hope all human service scientists will accept this method

The Basic Record will be kept by the individual as a part of his program of self management of life It will be imperfect. It will, in many cases, be started and allowed to drop It will seldom be kept up in its perfect form and function 100% It will, however, even when neglected, be resorted to in the emergency of illness It will be useful and refreshed when pain and trouble comes and all aid and resources are sought for Then it will be rummaged out of an old desk or bureau drawer and sometimes it will help

In short, the principle is sound Its application timely It is a step in the forward direction of the application of good intent, good sense and scientific wisdom and should be put on foot.

This document has been prepared as a preliminary aid to a conference on the actual preparation of the form of the Basic Record in New York City Whoever is interested in health and whoever makes examinations of a health or medical character should have an opportunity to interest himself and take part in the putting of this project forward Many men and many institutions have contributed to the making of this step possible. It is true that there is much to be considered, many safeguards to be thrown around the procedure, objections to be raised and overcome, further functions to be studied and adjustments toward the future usefulness in relation to the practice of medicine and the sciences relating to human welfare in which the Basic Record should serve an important, though simple purpose

The first step is to see the project clearly together, then to draft an acceptable form, devise ways of getting these records into the hands of the people and motivating their use, and to work together

The idea is basic to a well-managed civilization It preserves individual initiative and gives common sense and intelligence their self earned rewards

It is thus an expression of the democratic ideal and method, which we in America value highly It may do something to help various health agencies to know each other better and to help them aid each other This is always good sense and always the way of progress

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B LIBER, M D, DR P H, *New York City*

Editorial Note Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

Four Night Calls

Any physician in private and general practice may be called in an emergency to diagnose some form of true or false psychosis and should know how to distinguish it from intoxication or from more or less normal emotional states

One doctor was taken by the alarmed policeman on the beat to see a young girl who, arriving at two o'clock in the morning with her boy friend in an automobile, had climbed into her parents' stoop apartment through the window The officer, in face of the young woman's violent opposition to be removed to the police station, had diagnosed insanity and, to prove it to her parents, wanted the nearby doctor's corroboration The physician, however, hurriedly reaching the scene in his night-robe, found the offender just drunk —and that settled the question

* * *

A mother of eight children was pregnant again and not far from childbirth The oldest daughter called a physician late at night because she had seen a convulsive attack and "signs of insanity" He promptly made the diagnosis of eclampsia and began to prepare for the prescribed treatment, when he felt a strong smell of whiskey He looked again at the semi-unconscious woman's face and re-examined her entirely There was no doubt that she suffered from an acute alcoholic intoxication The daughter, however, protested saying "It is true that mother drinks once in a while, but this is impossible now I have been here the whole day for the last two months and I never leave her alone." But the doctor put his hand under the patient's pillow and out came a large flat

bottle half filled with liquor At which the girl exclaimed "Oh, again. She is terrible"

* * *

The doctor knew a married couple, she a Swiss Catholic and he a Polish Jew One night the doctor was called by the husband for the purpose of "taking her away to Bellevue," as he said She was, indeed, in a very wild and excited condition, had broken her crockery over his head and was literally tearing her hair out. Nearby in a crib their small child was breathing heavily and his cheeks were very pale. As the doctor started to uncover it, the father came closer and turning his bruised face to the light, said "Yes, we know the child cannot live Our family physician was here an hour ago and told us so In fact this is the cause of her anger She claims it is my fault because I discouraged her from baptizing the boy She still believes in such things"

The doctor wanted to attend to the little patient, but the mother did not allow him to do anything, remarking "There is no use, he is dying" She explained at great length her side of the story and did not let her husband interject one word. Meanwhile the child's respiration ceased It was dead. Then the mother became perfectly quiet and composed and kissed her husband asking him to pardon her She was normal again

* * *

A doctor was called in a hurry at midnight to a house two blocks away An Irish woman of fifty whom he had never seen before lay prostrate on a couch She was motionless and her face was deeply cyanotic Her arms, when lifted by the doctor, fell back limp, without the slightest tonus or resistance The heart seemed to have ceased to work completely, but the pupils reacted sluggishly to light and a very faint and shallow breathing was visible There were several female neighbors chattering in the room, mainly about how the event had affected *them*—the usual thing, at such occasions No one could give any information as to the past history of this patient Quick action was necessary The women were silenced and organized to help efficiently by bringing from the kitchen what was needed Besides some hypodermic injections given to the patient, massage of the heart and other therapeutic measures were instituted An hour passed The heart showed no life.

Except for a vague cat's cry or a feeble and distant violin sound, the night was still The doctor almost began to be discouraged when he heard, upon application of his ear to the patient's chest, a gurgling and bubbling noise coming from the heart region

At that moment one of the neighbors asked him whether he had no objection to a priest being sent for Impatiently he replied that that was none of his business and that she could do as she liked Within a few minutes the minister slipped in noiselessly and sat down at a respectful distance watching the struggle with death

The heart improved more and more and, as it came back to life, it was easy to recognize the long and loud systolic and diastolic murmurs that must have been the patient's usual cardiac symptoms, not to speak of the great arhythmia She opened her eyes, closed them again and then opened them definitely and looked around, while her color partly returned She understood and smiled and began to talk Yes, she had always had a heart disease and her present attack came because her son had not arrived home that evening She was a widow and had only this boy She was witty and joked

"Doctor," she said, "how will I pay you? *He* has the cash Maybe everybody else tells you the same thing It is like the people who wanted money for fixing the village church They organized a dinner and dance and they needed liquor A barrel was placed at the entrance and all the worshippers had to bring some whisky and pour it in But they were all shrewd and each one said to himself, I can give a bottle of water, nobody will know it, all the others will come with the real stuff and there will be plenty of it At the end the barrel contained water only"

Then the son entered and, as she looked into the direction of the door she noticed the clergyman She almost fainted again

"You here? Get away! I hate priests I don't want you I've never gone to Church Nor did my husband Go! If I have to die, I can die without you"

The doctor was dumbfounded He took his satchel and disappeared All the neighbors left in a hurry at the same time

An hour later the doctor's bell rang A young ambulance physician came in to his office and said that one of the Irish woman's neighbors had called up saying there was a "crazy person" to be taken to the Asylum

"I looked her over and I want to know what you think about her"

To which the older doctor replied

"She has her opinions and they may be extreme, but we as physicians do not have to mix in There is certainly no mental disturbance"

611 W 158 St

Highlights of the 1938 Annual Meeting

For Complete Program, see April 1 issue

(All activities will be held on Daylight Saving Time)

TIME AND PLACE—Opens Monday, May 9, 9·00 A M, at the Waldorf-Astoria Hotel, between Park and Lexington Avenues and 49th and 50th Streets, New York City Closes Thursday, May 12, 10 30 P M This will be the largest State Medical Meeting in size and scope ever held, and probably the largest attended Medical Meeting in the United States this year

REGISTRATION—Registration will be held in the Hotel on Monday after 9 00 A M for Delegates, and on Monday, Tuesday, Wednesday, and Thursday for members and guests Every physician must register and obtain an official badge to attend sessions

BUSINESS—The House of Delegates of the Medical Society of the State of New York will convene at 10 00 A M on Monday in the Ballroom.

GENERAL SESSIONS—Two General Sessions will be held, one on Tuesday, 2·00 P M, and one on Thursday, 2·00 P M, in the Ballroom

SECTION MEETINGS—Fifteen Scientific Sections will hold twenty-eight sessions on Tuesday morning, Wednesday morning and afternoon, and Thursday morning in the hotel *(See complete program for locations)*

GUEST SPEAKERS—Twenty-eight prominent guest speakers in all fields of medicine will address General and Section Meetings

SCIENTIFIC EXHIBITS—Fifty-six scientific exhibits, to be located in the First and Second balconies of the Ballroom and the Second floor foyer, are a part of the program

SCIENTIFIC MOTION PICTURE EXHIBIT—Forty-four scientific motion pictures by twenty-five exhibitors will be shown in the Empire Room from 9 00 A M Monday until 10 15 P M Thursday evening

TECHNICAL EXHIBITS—One hundred and ninety-two exhibits of leading pharmaceutical, surgical, and allied products and services will be open during convenient hours throughout the convention This will be the largest number of exhibitors ever to take part in a State Medical Meeting For the benefit of physicians with office hours which do not permit spending much time at the meeting during mornings and afternoons, the exhibit rooms will be open until 10 30 P M on Tuesday

BANQUET AND DINNERS—The Annual Banquet and Reception will be held in the Ballroom of the Hotel on Tuesday, at 7·00 P M (Tickets are limited—application should be made to Augustus Harris, M D, Chairman of Banquet Comm, 2 E 103 St, New York City) Dinner for the Delegates will be served in the Hotel on Monday following the adjournment of the afternoon session of the House of Delegates (Tickets can be procured from the Secretary of the State Society, 2 E 103 St, New York City)

WOMAN'S AUXILIARY—Headquarters are in the Carpenter Suite of the Hotel, and the ladies are asked to register at the Registration Desk in the Suite after 9 00 A M, Monday Meetings and the Dinner will be held on Monday A hobby show will be open during the four days of the Annual Meeting, May 9, 10, 11 and 12

EDITORIALS

Proof by Trial

In the past ten years American medicine has waged a bitter fight against compulsory health insurance It has warned that bureaucratic control of healing is expensive and inefficient, that it lowers the quality of medical care, and fails to succor those most in need of help

Abraham Epstein, Executive Secretary of the American Association for Social Security, has long been a foremost exponent of compulsory sickness insurance On April 7, however, he denounced the Social Security Act as "unwieldy, inadequate and unsocial" and charged that the old-age pension systems in many states are "sinks of corruption"

In other words, experience with Old Age and Unemployment Insurance supports the profession's indictment of compulsory sickness insurance The enormous reserves which are piling up are an invitation to governmental extravagance The vast bureaucracy which is developing is a spur to nepotism and political favoritism

The extension of bureaucratic rule in this country is a source of alarm to thoughful students of government It is a parasitic growth upon the nation's economy Nonproductive itself, it saps the earnings of productive workers in agriculture, industry, and the profession

In view of the disappointing performance of the Social Security Act in its present form, it is surprising that some socially-minded politicians still look to its extension to solve the nation's health problems There is nothing in the history of compulsory sickness insurance or recent experience with old age and unemployment insurance to nurture the belief that better health lies in that direction

At the forthcoming Annual Meeting of the Medical Society of the State of New York the House of Delegates will consider a public health program embracing government aid to the medically indigent Needless to say, to be acceptable to organized medicine any such program must provide for medical control over medical matters, without the interposition of a third party between doctor and patient.

Transfer to the profession of responsibility for the medical aspects of Workmen's Compensation has resulted in vastly improved treatment of industrial injuries Continued medical progress and the maintenance of high professional standards demand the retention of medical control over practice in general

Driving Out Syphilis

With Governor Lehman's signature of the Desmond-Breitbart Act, New York State takes the lead in the nation-wide

fight against syphilis The new law, which will go into effect on July 1, requires all applicants for marriage licenses to submit to a serological test for lues No license will be issued if the disease is found in a communicable stage This reinforces the Twomey-Newell Law, which requires serological examination of pregnant women immediately upon the determination of pregnancy

Properly enforced, these statutes should effect a perceptible decline in congenital syphilis It is difficult to pick out the infected adults in a community and persuade them to remain under treatment With the new laws passed this year, it should be comparatively easy to prevent infection at the outset of marriage and hereditary transmission of the disease to the newborn

These laws place a definite responsibility upon the physician If the required examinations are carelessly made or certificates are issued on faith, the whole profession will share the stigma of a careless or dishonest few There is no place in medicine for a counterpart of the "marrying parson"

Naturally enough, the success of these new statutory weapons against syphilis will depend to a considerable extent upon public cooperation The prescribed prenatal tests cannot easily be avoided Anyone desiring to evade prenuptial examination can do so by having the marriage ceremony performed in another state Young people must be taught that this requirement is not an intrusion on their privacy but a necessary protection for themselves and their unborn children

Evaluation of Pregnancy Tests

Ever since the introduction of biological tests for pregnancy by Ascheim-Zondek and Friedman, investigators have been searching for other methods which would be simpler, less expensive, quicker, and 100% accurate These two tests have, in the hands of many, yielded results which have been ninety-nine per cent accurate, but it is the desire of clinicians to have a reliable means of determining early pregnancy by a simple office test which will yield a positive or negative result within a few minutes

In a critical review of the recent experimental work along these lines, Weisman[1] gives a comprehensive analysis of the various tests proposed Of the biological tests, neither the Zaharesco, the Stichling Melanophore Reaction, nor the Mazer-Hoffman tests can compare in accuracy with the two above mentioned The Kelley test may be employed to corroborate the Ascheim-Zondek, but not as a substitute for it. The others are either impractical or not sufficiently tried Among the allergic skin tests, only the Gruskin intradermal test affords some promise for practical use by the practitioner In this test a special placental extract is injected to form a wheal and the erythematous reaction is studied for the determination of pregnancy

Chemical tests have been proposed but of these, the urinary histidine and the Schmulowitz-Wylie are not accurate enough in the early period of gravidity The Visscher-Bowman test, however, while in its present form not reliable enough to supplant biological tests, gives promise of becoming a valuable diagnostic means once the technic has been altered and all sources of error eliminated It is inexpensive and quick, and when positive, is easily recognized by the reddish-brown flocculent precipitate in the specimen of urine

There are other means of laboratory diagnosis of early pregnancy reported in the literature, but none at present can be recommended For the time being, the Ascheim-Zondek and Friedman tests remain the only accurate tests available and should not be abandoned for more rapid or simpler ones until such time as one or more are discovered which will at least match these two in exactness

Vitamin K

The tendency to hemorrhagic diathesis in patients suffering from obstructive jaundice is well-known Hitherto, the control of this feature has been a different one, since neither the administration of bile, calcium or even whole blood exerts any appreciable influence on the prolonged prothrombin time Only when biliary obstruction can be relieved surgically are hemorrhages less apt to occur

In recent clinical studies conducted by Butt, Snell, and Osterberg,[1] it was found that when Vitamin K was given to jaundiced patients, there was an appreciable reduction in the elevated prothrombin time, approaching, in some instances, the normal limit This finding was noted only when bile was either present in the intestinal tract or was administered together with the vitamin When given alone, the latter had no effect on the prothrombin time These observers found that clinically there was an inhibitory influence on free bleeding and a preventive action on the tendency to hemorrhages

The vitamin itself is present in cabbage, spinach, tomatoes, and alfalfa, the latter affording the most abundant source[2] From the human body itself, it can be recovered in large amounts from the feces From observations to date, it seems that Vitamin K is absorbed, with the aid of bile action, in the sterols and that it then plays a distinct role in the clotting of blood Whether it accomplishes this by an alteration of the prothrombin content of the blood or by exerting an effect on the activity of prothrombin is as yet undetermined

Its use in combination with bile or bile salts in the pre- and postoperative care of patients suffering from jaundice has not attained standardization No routine method of treatment has as yet been formulated but these early reports are encouraging At present the use of Vitamin K and bile should be put to extensive clinical trial since it is the only therapeutic means advanced to date which gives some hope of arresting the appearance of hemorrhagic diathesis in obstructive jaundice

CURRENT COMMENT

"YOU REMEMBER PAVLOV'S EXPERIMENT How he rang a bell every time he fed a dog After a while, the dog's gastric juices flowed whenever he heard the bell Even if there wasn't any food

"A similar experiment is now taking place in the United States The administration is playing the role of Pavlov Its propogandists are the bell-ringers. The public, of course, is the dog It is being fed exaggerated promises of what socialized medicine would accomplish

"Repeated ringing, it is assumed, will deafen the lay ear to the advantages of private practice Echoing state medicine's 'benefits,' it is hoped, will make them seem real Once socialized medicine is 'in', the food can be taken away The promises can be forgotten But the political structure created will remain

"As yet, the public has shown no particular appetite for this dish So it has been ordered that the bells ring louder

"Thus is the public being conditioned to accept something it doesn't need and will suffer by having"—From an editorial by H Sheridan Baketel in April's *Medical Economics*

"HOW OFTEN WE HEAR MEN, in discussing depression and world unrest, say—'There are too many people on earth What we need is another war to kill off the surplus!' And each time we think what a sad commentary this is in our present day civilization Just twenty years ago we fought a war involving almost all of the nations which resulted in the killing of millions of combatants, not to mention the millions of women and children who died of starvation Yet the same old problems are again with us So war cannot be the answer The next time someone advocates slaughter of the excess population, we shall say 'You first, brother There is always a small war somewhere to accommodate you!'"—Timely comment by *The Milwaukee Times* of recent date.

"No GROUP DESIRES ADEQUATE care for the sick more than the medical profession But we see very clearly the tremendous difficulties confronting those who would solve it And we feel that we are entitled to a hearing on the strength of our past record Organized Medicine is really an organism, it is a living, breathing thing" —Statement of fact by the *Weekly Roster*

IF COMPULSORY SICKNESS INSURANCE legislation is enacted in the state of California, the *Los Angeles Medical Bulletin* feels that the consequences would be somewhat along the following lines "The Medical Profession suffering the evils of regimentation, experiences the loss of altruism, and we will see a group of highly minded individuals reduced to a commercially minded labor union organization, where walk-outs, strikes and other unthinkable tactics will become necessary to fight for our place in the sun, rather than the cheerful idealistic service which it is now our privilege to render Social legislation is in direct opposition to the sound principle that the entire force mankind exerts is the accumulative aggregate, egocentric influence of the individual which reaches its maximum when initiative is stimulated, sustained and rewarded, and when the reward is denied that force quickly dies out so that the attempt to regiment us all into unthinkable automatons, numbered, yes, even lettered with the alphabet, is a destructive movement, not one of social progress"

"THE FURY OF THE DEMAGOGUES remains unabated in attacking Medicine Politics and Medicine do not mix Conceivably they might with a proper protective colloid, but who is to furnish this colloid? The politicos do not know how, the public is misinformed and does not know how, all attempts at reasonable suggestions by scientists themselves are shouted down with howls and sneers of derision

"'Human rights are greater than property rights' Granted! Also granted that two is equal to two! A piece of bread is property If you do not have it you starve The right to eat the bread is a human right. Therefore human rights are greater than human rights Quod erat demonstrandum Why free medical service? Why not free food, free rent, free movies? 'Bread and circuses for the people!' 'We planned it that way, my frans'

"Science is factual, demagogy is emotional Oil and water!

"It will all pass A mighty Caesar in his purple reviewing his legions would have given the impression of eternal Rome in deed. An ancient sage remarked as he gazed in awe at the mighty palaces of Imperial Rome, 'This too will pass' It did"—The incompatibility of "Oil and Water" discussed in an editorial in *The Medical News of Rock Island County*

Correspondence

To Mr K, Pharmacist, New York City

Thanks for your praise and that of your medical friends concerning the series of articles "Between Mental Health and Mental Disease" While you disagree with my contention expressed in one of them that preventive medicine is not exactly the same as health conservation, it is regrettable that in your very brief and unsigned note you failed to give us the reason for your disagreement.

I regard health conservation as all embracing and preventive medicine as one of its components Whatever is done socially and individually to conserve and improve and perfect both collective and personal health is health conservation Preventive medicine may be stretched to have the same meaning—and I would have no objection to that—but it is ordinarily used in the limited sense of treating a patient who is already ill so that worse illness may be prevented, or of treating large groups or single persons exposed to infection or contagion. Vaccination against smallpox or prophylactic injection of antitoxin into diphtheria contacts are examples of preventive medicine The introduction of exhaust apparatus in factories dealing with dusty industries or gymnastic exercise for sedentary workers belong to health conservation Health conservation means the creating or encouraging of the circumstances which will keep the entire population or any person in good health

Preventive medicine is in short, an effort to cure a condition which, if neglected, may develop into further disease. While preventive medicine still belongs to therapy —of a higher sort, but therapy nevertheless —health conservation is greater than that and involves more than medical help It is the sum or the result of the work of all agencies for social betterment, even of those which are originally intended to achieve other improvements

Annual Reports

Supplementary Report of the Special Committee on Matters Pertaining to Medical Care

To the House of Delegates, Gentlemen

Your Committee submits the following study of suggestions for a State Health Policy in the field of Mental Hygiene as an appendix to its formal report which appeared in the April 1, 1938 issue of the NEW YORK STATE JOURNAL OF MEDICINE (page 552)

In matters pertaining to medical care and to a State Health Policy, it now seems necessary to give more consideration to mental illness and mental health than has, in the past been accorded them either by the general medical profession or the public. Great advances have been made in the conception of the nature of mental illness, of its prevalence, of its relation to physical symptoms and disabilities, and of the measures required for its adequate treatment and prevention.

The prevailing conception of mental illness was formerly confined almost entirely to the gross, incapacitating, socially disturbing manifestations embraced under the terms insanity and mental deficiency Provision for its treatment was left almost entirely to the public authorities Private philanthropy contributed comparatively little, and it has been singularly neglected in medical education and in general medical practice It seems necessary, therefore, in this report to review briefly the present policy and provision for dealing with the problem in the State.

Starting in colonial times with crude forms of lockups and poorhouses in which insane persons were confined, the present excellent State Hospital system for the mentally ill has been gradually evolved. In the establishment of this system the State Medical Society had an important part. Beginning in 1836, the Society memorialized the Legislature and engaged actively in securing public support and legislation for the Utica State Hospital, opened in 1843 In 1864, the Society recommended the appointment of a commission to visit poorhouses in which insane persons were still confined and to report to a committee of the Legislature their condition and treatment. The service of physicians throughout the State was enlisted and a report was made relating to 1345 such persons inadequately cared for in poorhouses A bill was thereupon passed for the establishment of a second State Hospital with a view to making State provision for all such cases This marked the adoption of the principle of "State Care of the Insane" which, however, did not become fully operative until 1890 In recognition of the service rendered by the Society, and especially by its Secretary, Dr S D Willard, the law for the establishment of the new hospital was called the Willard law, and the new hospital, opened in 1869, was named the Willard State Hospital

The extent to which the State has assumed responsibility for the hospital treatment of mental illness is revealed in the fact that ninety-five per cent of the hospital beds provided for mentally ill persons are in the State hospitals The task is so enormous, and is historically so different from that relating to other forms of illness that, for its administration, a separate department known as the State Mental Hygiene Department was created. Like the State Health Department, this is a medical organization, under a medical commissioner and employing in its administration and in its twenty hospitals 402 full-time salaried physicians and dentists and a large number of part-time visiting and consulting physicians who serve without compensation or with a nominal stipend The number of patients under the care of these hospitals is 72 000 The department also conducts five State schools for the mentally deficient and one for the epileptic These are also medically administered, the number of physicians employed being fifty-eight. The number of the mentally defective patients is about 16 000, and of the epileptic patients 2,500 The State provides altogether about 82,000 beds for the treatment of the mentally ill The cost of maintenance and department mental administration exclusive of interest and depreciation for the year ending June 30, 1937, was over $30,000,000 The average annual rate of expenditure for construction during the past five years was over $8 000,000

In addition to the hospitals and institutions conducted by the State, some of the municipal and a few of the voluntary general hospitals in various cities provide special services for diagnosis and for relatively short periods of treatment of the mentally

Report submitted by Dr Wm. L. Russell, on request of Chairman, on Care and Prevention of Mental Illness

"No GROUP DESIRES ADEQUATE care for the sick more than the medical profession. But we see very clearly the tremendous difficulties confronting those who would solve it. And we feel that we are entitled to a hearing on the strength of our past record. Organized Medicine is really an organism, it is a living, breathing thing."—Statement of fact by the *Weekly Roster*

IF COMPULSORY SICKNESS INSURANCE legislation is enacted in the state of California, the *Los Angeles Medical Bulletin* feels that the consequences would be somewhat along the following lines. "The Medical Profession suffering the evils of regimentation, experiences the loss of altruism, and we will see a group of high-minded individuals reduced to a commercially minded labor union organization, where walk-outs, strikes and other unthinkable tactics will become necessary to fight for our place in the sun, rather than the cheerful idealistic service which it is now our privilege to render. Social legislation is in direct opposition to the sound principle that the entire force mankind exerts is the accumulative aggregate, egocentric influence of the individual which reaches its maximum when initiative is stimulated, sustained and rewarded, and when the reward is denied that force quickly dies out so that the attempt to regiment us all into unthinkable automatons numbered, yes, even lettered with the alphabet, is a destructive movement, not one of social progress."

"THE FURY OF THE DEMAGOGUES remains unabated in attacking Medicine. Politics and Medicine do not mix. Conceivably they might with a proper protective colloid, but who is to furnish this colloid? The politicos do not know how, the public is misinformed and does not know how, all attempts at reasonable suggestions by scientists themselves are shouted down with howls and sneers of derision.

"'Human rights are greater than property rights.' Granted! Also granted that two is equal to two! A piece of bread is property. If you do not have it you starve. The right to eat the bread is a human right. Therefore human rights are greater than human rights. Quod erat demonstrandum. Why free medical service? Why not free food, free rent, free movies? 'Bread and circuses for the people!' We planned it that way, my frans.'

"Science is factual, demagogy is emotional. Oil and water!

"It will all pass. A mighty Caesar in his purple reviewing his legions would have given the impression of eternal Rome indeed. An ancient sage remarked as he gazed in awe at the mighty palaces of Imperial Rome, 'This too will pass.' It did."—The incompatibility of 'Oil and Water" discussed in an editorial in *The Medical News of Rock Island County*

Correspondence

To Mr K., Pharmacist, New York City

Thanks for your praise and that of your medical friends concerning the series of articles "Between Mental Health and Mental Disease." While you disagree with my contention expressed in one of them that preventive medicine is not exactly the same as health conservation, it is regrettable that in your very brief and unsigned note you failed to give us the reason for your disagreement.

I regard health conservation as all embracing and preventive medicine as one of its components. Whatever is done socially and individually to conserve and improve and perfect both collective and personal health is health conservation. Preventive medicine may be stretched to have the same meaning—and I would have no objection to that—but it is ordinarily used in the limited sense of treating a patient who is already ill so that worse illness may be prevented, or of treating large groups or single persons exposed to infection or contagion. Vaccination against smallpox or prophylactic injection of antitoxin into diphtheria contacts are examples of preventive medicine. The introduction of exhaust apparatus in factories dealing with dusty industries or gymnastic exercise for sedentary workers belong to health conservation. Health conservation means the creating or encouraging of the circumstances which will keep the entire population or any person in good health.

Preventive medicine is in short, an effort to cure a condition which if neglected may develop into further disease. While preventive medicine still belongs to therapy —of a higher sort, but therapy nevertheless —health conservation is greater than that and involves more than medical help. It is the sum or the result of the work of all agencies for social betterment, even of those which are originally intended to achieve other improvements.

March 15, 1938 B. LIEBE, M.D

wider diffusion of knowledge relating to personality, mental illness and disability, and psychotherapy, has brought a new group into the field, consisting of psychologists, clergymen, psychoanalysts, social workers, and others who, without a medical education, undertake to give advice and to treat conditions that would tax the best resources of a physician well-qualified in psychiatry The history of the treatment of the mentally ill clearly demonstrates that psychiatry is and must continue to be a branch of medicine. Its practice necessitates ability to investigate the whole nature of man, his mental as well as his physical organization and functions, and to make a diagnosis of his condition, when ill, as a whole person as well as a collection of parts This can only be adequately performed by a physician, and the medical profession must qualify its members and its organizations to deal with the problem as intelligently, honestly, and effectively as it deals with other medical problems

It is evident that the problem is now so outstanding that it must be given a large place in the further development of medical education, of medical care, and of a comprehensive State Health Policy It is large and complex, but some of the lines of progress and desirable objectives seem to be sufficiently clear to enable the Committee to present for consideration the following summary and suggestions

1 The problem of mental illness has assumed such dimensions that a much wider development of resources than those established by the State for the "Care of the Insane" has become necessary

2 The central aim of further developments should be the "Care and Prevention of Mental Illness," and its accomplishment should be included in the aims of a General State Health Policy

3 For its advancement the outpatient, educational, research, and preventive work established by the State Department of Mental Hygiene should be organized, and administered as a clearly recognized extension of its activities beyond hospital service to patients, and provision should be made for its separate supervision in the department, and for its financial support and further development.

4 Better provision should be made for the education of physicians, medical students, nurses, and social workers, in the nature, treatment, and prevention of mental illness and the splendid facilities of the State and other hospitals should be more fully utilized for this purpose.

5 Access to competent professional service and hospital facilities should be as easily available in mental illness as in any other form of illness To facilitate this, the laws relating to mental illness, which reflect the conception of "the Care of the Insane" should be revised

6 Every organized community should have available for private practice, for service in the general hospital, for outpatient service for adults and children, and for school and court services, one or more physicians and nurses well qualified in mental illness

7 Suitable facilities for the admission and treatment of mental illness should be accepted as an essential in all general hospitals Modern sound-proofing and air-conditioning have removed all obstacles that have heretofore made this difficult. The special structural, equipment, and personal requirements are as essential to adequate service as those for surgical, obstetrical, and communicable disease services

8 In furtherance of this policy and development the State Medical Society may have an even more important part than it had, many years ago, in the establishment of the State Hospitals and the State Care System By cooperating with the State Department of Mental Hygiene in advocating needed developments and necessary legislation and appropriations, and in mobilizing medical opinion and support, some very important advances may be facilitated The influence of the Society and its members may be turned to account in advancing medical, nursing, and social work education in mental illness, and in securing better service and hospital facilities for this form of illness in the different communities The meetings of the Society and of its district branches, also those of the County societies may, with advantage, give more attention to mental illness and mental hygiene

More papers on these subjects on the programs and in the JOURNAL and Bulletins would contribute to the information and interest of the members The problem has reached such proportions, and is so important that a special section of the Society, on Psychiatry and Mental Hygiene might, perhaps, accomplish more than might otherwise be possible. This seems especially indicated, because there is no State Psychiatric Society A special committee would also enable the Society to keep informed of conditions and developments, and to cooperate with the State Mental Hygiene Department, with other medical societies, and with mental hygiene organizations in the advancement of measures and developments of which the Society approved

ill Most of these services are not organized and equipped for the prolonged study and treatment of the many conditions presented by mental illness, and they are limited in the scope of their work by legal restrictions We are unable to state the exact number of beds thus provided, but believe a liberal estimate would not be more than 1,500

Thirty-one private institutions, of which only a few are well-organized hospitals, are licensed and supervised by the department The number of patients thus provided for is about 4,000

It appears, therefore, that, in contrast with the provision made for other forms of illness, the tax-supported hospitals provide for fully ninety-five per cent of the cases of mental illness that are known to be receiving hospital treatment in the State It also appears that, notwithstanding the character and magnitude of the provision thus made, it does little more than furnish treatment for the more manifest and advanced forms termed insanity

For many years the main object aimed at in the provision made for mental illness, public and private, has been "The Care of the Insane" The task has been slow and difficult and we have reason to be proud of the extent to which it has been accomplished in this State It is evident, however, that the problem of mental illness will not be solved, any more than the tuberculosis problem could be solved, simply by building more and larger hospitals for the more manifest, advanced, often terminal cases, and at the same time neglecting the early stages and the conditions in which they originate in the communities This has long been realized by those engaged in the work, but prevailing conceptions and standards have been only gradually advancing to permit the practical developments needed For a number of years, however, the State Mental Hygiene Department and its hospitals have, as best they could without adequate recognition and support by the Legislature, been extending their activities beyond the hospitals, in the form of outpatient and social service, and by public education by means of addresses, literature, and cooperation with other organizations in mental hygiene activities The laws have also been gradually liberalized to facilitate access to hospital treatment without unnecessary and obstructive legal formalities Local provision for temporary treatment has been advancing, and the health officer has replaced the poormaster in the duty of seeing that mentally ill persons in the community obtain needed hospital treatment. The State has also led the way in advancing the education of medical students and physicians in mental illness, and for scientific research, in the establishment of the State Psychiatric Institute at Columbia University Medical College.

Great advances have been made in the understanding and attitude of the public concerning mental illness It is more clearly discerned that the patients under treatment in the hospitals for mental illness became ill in the communities and that few of them received skilled attention until their condition became so aggravated that hospital treatment was imperative It is also realized that many less incapacitating conditions than insanity, known as nervousness, neuroses, personality disabilities and peculiarities, behavior disorders, psychopathic states, etc, belong to the same class of illnesses as those termed insanity This has led to many new developments The medical, nursing, and social work schools are giving fuller and better courses of instruction and training in mental illness and in the personality factors in all forms of illness and disability Research is receiving more attention and support. Many outpatient services and child guidance clinics have been established, in addition to those conducted by the State. General hospitals are making provision for more adequate treatment of mental illness, and of the mental problems presented by patients under treatment for physical conditions Psychiatric and mental hygiene service has been introduced into schools, colleges, industrial organizations, courts and correctional institutions, and has been greatly extended in private medical and nursing practice

Mental hygiene organizations have been established for the purpose of advancing the education of the public in regard to mental health and mental illness, and of promoting measures and provision for cure and prevention This has become a widespread movement that is sponsored and, in considerable part, conducted by persons without medical training Most of the organizations, however, look to physicians who are qualified in psychiatry and mental hygiene for guidance and leadership, and are entirely dependent upon them for maintaining soundness in the movement This presents an opportunity and a responsibility that the medical profession should be prepared to accept It has always been recognized that the forms of mental illness that were socially most disturbing were subjects for medical responsibility and treatment The less incapacitating forms and stages have, however, furnished a rich harvest for honest and dishonest healers, and for ignorant and educated charlatans Now, the

CANCER CONTROL

The Doctor and the Cancer Patient

JAMES EWING, M D , *New York City*

When a patient with cancer enters a doctor's office, an emergency is created With correct diagnosis and expert treatment, life is often saved, but the alternative invariably results in the death of the patient. No such situation exists with any other major cause of death

Four types of cancer patients enter a doctor's office

1 The patient may present an obvious cancer, as a hard lump in the breast, or an indurated ulcer of the tongue.

2. The patient may give localized symptoms suggestive of a deep or inaccessible cancer, as *persistent pain in the stomach*, or persistent pain in a long bone, or blood in urine or stools

3 The patient may present an obvious precancerous lesion, as a pigmented mole, or leukplakic spots in the *mouth*.

4 The patient may complain of not a single symptom of cancer which nevertheless exists and may even be advanced. Fortunately this last group is small.

All four classes of patients now frequently fail to receive a diagnosis of cancer by the doctor or doctors consulted Statistics show that twenty-two per cent of cancer cases come to autopsy without diagnosis, and that ten per cent of the diagnoses of cancer are erroneous Therefore, the diagnosis of cancer should be more frequently entertained by the doctor, and when adopted should be more carefully verified

1 Diagnosis of Obvious Cancer

When a patient presents an obvious cancer, the emergency *requires that the doctor* should decide at once what to do He must decide whether he is *himself able to make* an exact diagnosis, to carry through effective treatment, and to deal with recurrences if they develop He should not tell the patient that he has cancer and he should not, as a rule, make a biopsy If he is not able to carry out these measures fully he should immediately make arrangements to send the patient to some place where they can be properly carried out This means the concentration of cancer patients in special cancer hospitals or in general hospitals which are equipped for the most modern cancer diagnosis and treatment.

There may be many situations where the patient cannot for various reasons secure these special services, and the doctor will have to do the best he can unaided, but then it should be recognized that under these conditions the patient seldom gets the best possible treatment.

There are many mistakes made in the initial handling of obvious cancer, and these mistakes usually result in the death of the patient. The cancer may be mistaken for a benign process Much experience is necessary for the diagnosis of many established cancers Delay is generally dangerous Some cancers of the tongue, breast, and uterus reach an incurable stage within a few weeks A biopsy is done by unwise methods, the specimen is sent to some distant laboratory without adequate fixation fluid and with poor clinical data, several days elapse before the report is returned, and the report may be inaccurate There are comparatively few laboratories where accurate diagnosis of biopsy material can be *obtained* In a few circumstances a small portion of tissue may be removed at once in a *doubtful case*, as with ulcerating lesions on tongue, skin, cervix, uterus, or rectum, but as a rule the biopsy should be made by the surgeon who is going to take full charge of the case When the patient reaches a hospital manned by competent cancer specialists, a biopsy is often found unnecessary, or it is replaced by other methods of diagnosis A clean incision by a sharp scalpel is the best method of taking biopsy material

Much harm is frequently done by a hasty resort to biopsy Breast tumors should probably never be incised Enlarged lymph nodes seldom require a biopsy because the diagnosis may usually be made on the clinical characters of the disease and the response to radiation It is generally a grave error to

This paper is published through the cooperation of the American Society for the Control of Cancer and its New York State Committee, the Cancer Committee of the Medical Society of the State of New York, and the New York State Department of Health

ANNOUNCEMENT

The Annual Banquet of the Medical Society of the State of New York will be held on Tuesday evening, May 10, at 7 P M in the Grand Ballroom of the Waldorf-Astoria, Park Ave and 49th St Subscriptions will be $5 00 per person (including gratuities) Tickets to be collected at tables An excellent menu has already been arranged Outstanding speakers and distinguished guests will attend Fine music will also be provided including a fifteen-piece orchestra for dancing afterward As it is only possible to conveniently accommodate about eleven hundred, it is important for you to send your subscriptions early This will also facilitate the work of the committee in arranging for the seating for such a large number Will you, therefore, kindly plan now for the number of guests, with names, whom you expect to include in your party, or state preference of persons with whom you wish to be seated Cocktails will be served at the assigned tables in the Ballroom upon individual order, at any time after 6 45 P M

Please forward checks *promptly,* at $5 00 per cover payable to Dr Augustus Harris, 2 East 103 Street, New York City, Chairman Dinner Committee

Convention Exhibits will be illuminated
and open to display until 10 30 P M

To Dr Augustus Harris, 2 East 103 Street, New York City

Enclosed please find check to the amount of $ for covers for the Annual Banquet

My guests will be

I wish to be seated with

Signature

give headache, choked disc, mental disturbances, vomiting, focal symptoms and sometimes radiological signs Search for a primary tumor in another part of the body is indicated, since many metastatic tumors of the brain are operated upon as primary growths In the nasal passages any chronic discharge, bleeding, pain, or swelling should be investigated for tumors of the sinuses, nasal mucosa, or bones Most tumors of this region are long treated for simple chronic catarrhal inflammation, especially in the antrum Cancer of the nasal mucosa and pharyngeal vault in young subjects is nearly always long overlooked Lymphoepithelioma of the nasopharynx and tongue give very small primary tumors and first appear as tumors of the neck nodes A very thorough examination of the entire nasopharynx by an expert is the only method of excluding cancer in this region.

A single, very much enlarged tonsil calls for the diagnosis of lymphosarcoma and treatment by radiation Or, both tonsils and the entire pharyngeal ring may be considerably enlarged and reddened, before cervical nodes appear This is the only period when lymphosarcoma of the neck can be successfully treated

Cancer of the tonsil, base of the tongue, or pharyngeal wall often gives very difficult diagnosis problems The tumor may be flat and eroded, or definitely ulcerated or diffuse and hard to delimit All indurated ulcers of the tongue and floor of mouth should be regarded as cancer until definitely proved to be of some other nature A biopsy is the only safe method of diagnosis

Enlarged cervical lymph nodes are a difficult and an ever recurring problem. I believe the most important evidence here is a careful clinical history This generally establishes the nature of tuberculous and other simple chronic infectious processes and it may reveal that the disease is systemic. Glandular fever occurs in young subjects who are well nourished and not anemic and the lymphadenopathy is widespread The rather firm, often localized, nodes of Hodgkin's disease appear in subjects who are poorly nourished Lymphosarcoma is a disease of perfectly healthy looking subjects who are often overweight The hard nodes of cancer are generally at first single. Thorough examination of all the areas drained by these nodes should be the first step in diagnosis. The common practice of immediately excising a cervical node for diagnosis is to be discouraged A high proportion of diagnoses rendered on this material are inconclusive or misleading The biopsy does harm in cancer and lymphosarcoma, but the simple aspiration biopsy of lymphnodes nearly always gives a positive result with cancerous nodes The therapeutic test by radiation is a better method Lymphosarcoma recedes rapidly after radiation Hodgkin's disease slowly, tuberculosis very little and with increase inflammatory reaction while most metastatic cancers resist. Radiation is the best treatment of most of these cases as well as a good diagnostic method. Surgery can always be employed later Persistent hoarseness calls for a laryngeal examination Chronic pulmonary symptoms now generally receive early study by the radiograph and pulmonary tumors are thus detected early, and the same method reveals early mediastinal growths

Patients with chronic gastric or intestinal symptoms are often unable to afford a radiographic study and some means should be provided in clinics to supply this service gratis A search for blood in the stools or urine is the least step that can be taken in the face of obscure abdominal symptoms A high proportion of rectal cancers still escape detection because the patient has piles in addition to cancer

The diagnosis of bone tumors is nearly always delayed until the disease has become established and the prognosis bad I would urge that every case of persistent unexplained pain in a bone be regarded provisionally as sarcoma and treated by radiation

This treatment cures giant-cell tumors, non-ossifying periosteal sarcoma and osteitis fibrosa cystica. It is not too much to hope that it may also cure many cases of early true osteogenic sarcoma, endothelioma, and myeloma, but it is quite certain that neither this nor any other method can cure the established stages of these diseases except in very rare instances Doctors will not make the diagnosis of bone sarcoma and patients will not accept it when the penalty is amputation

It is thus apparent that symptoms suggestive of cancer create an emergency for the doctor, drawing heavily upon his resources It is equally clear that in this field the doctor may be of inestimable service to his patient, because since ninety-five per cent of all established cancers are fatal, an early diag-

cut into a suspected bone tumor, especially a giant-cell tumor The radiographic findings and the response to radiation give a correct diagnosis in a very high proportion of cases The local removal of subcutaneous neurofibromas is responsible for a high proportion of recurrences and fatalities from this disease, which often proves to be malignant

The surgical removal of parotid tumors is a difficult task and may be safely entrusted only to surgeons who have a large experience in this field Otherwise the facial nerve may be cut and elongated portions of the tumor may be left The first step should be an aspiration biopsy If the tumor proves to be the ordinary mixed tumor, and the surgeon is skillful, resection is probably the best procedure If the tumor is an adenocarcinoma, radiation is the safest plan In some clinics radiation is always employed first, followed by interstitial radium if necessary, and finally by resection if demanded

The treatment of localized tumors of the breast is a difficult and complex problem Many small malignant tumors of the breast are removed in the doctor's office, a procedure often followed by prompt recurrence and a less favorable situation for radical amputation In dealing with lumps in the breast, the first step should be aspiration biopsy If the tumor proves malignant, then radical amputation is the standard procedure If the lump proves to be a cyst, then aspiration may suffice The aspiration biopsy avoids the complication of a surgical wound and permits radiation treatment, which should generally precede amputation of the breast The surgical biopsy should be employed when the aspiration method is not available, and should be performed only in a surgical operating room where a radical operation may be undertaken at once If indicated by the frozen section or gross examination of the tumor Radiation therapy is to be preferred with inflammatory carcinoma, when there are supraclavicular metastases, and under some other conditions It may completely sterilize small tumors, but is less effective with large growths and axillary extensions

The treatment of suspicious ulcers of the skin and mucous membranes by nitrate of silver is a very common and unwise practice It never cures, but always aggravates a cancer Dermatologists remove scores of quiescent moles in their offices and some assert that they never saw a recurrence, but in a cancer hospital it is very common to find such recurrences and the patient in a hopeless condition If a mole shows any signs of growth or increased pigmentation, it must be regarded as malignant, and the excision should be made with extreme care and with a wide margin of normal skin

The exploratory laparotomy is a very necessary procedure for the diagnosis of obscure abdominal tumors, but it need not be undertaken until other methods fail Not infrequently it is performed in cases of unsuspected carcinoma of the cervix, or carcinoma of the rectum, and more frequently still it is performed when pulmonary metastases are present. It is an excellent rule never to perform an operation for a tumor without taking a radiograph of the lungs This rule is broken in the very best surgical hospitals

In many cases of obscure malignant tumors, superficial and deep, the therapeutic test by radiation gives an excellent indication of the nature of the growth and is often at the same time the best treatment.

These, and many other difficulties in the diagnosis and treatment of obvious malignant tumors lead inevitably to the conclusion that the best interests of the cancer patients require, at least, consultation in a group clinic, or the reference of the case to a special cancer hospital, or special cancer service in a general hospital The experience available at the average general hospital or the equipment provided is usually inadequate to assure the best treatment of the cancer patient. The time is past when the mere ability to perform the standard surgical operation justifies the surgeon in undertaking the treatment of most forms of cancer This fact may be emphasized by the report that the average operative mortality for rectal cancer in nineteen American cities of a population of about 100,000 is forty five per cent while the mortality of many specialists is only five to ten per cent [1]

2 Diagnosis of Obscure Cancer

When the patient complains of symptoms suggestive of cancer another type of emergency arises calling for measures either to establish or to eliminate the diagnosis of cancer These symptoms may be referred to any part of the body

In the skull there are brain tumors which

1 Saltzstein, H C *J A M A*, 91 465, 1928.

that about seventy per cent of all cancers, mostly inaccessible, are beyond the reach of early diagnosis, and that their incidence can be affected only by preventive measures The alert general physician occupies the key position in this entire field, but the exercise of his function to the fullest extent requires an enormous fund of information and experience.

4 Atypical Cancer

Patients may come to the doctor with established and even advanced cancer and yet fail to complain of any symptoms of the cancer or of any other disease It is a remarkable but well established fact that the body can tolerate the growth of malignant tumors without any disturbance so long as the tumor tissue is well nourished and does not interfere mechanically with any function Some of these patients may appear to be in perfect health Usually they suffer from symptoms which are attributed to other diseases

A certain proportion of brain tumors result in sudden and unexpected death Cancer of the stomach, lung, thymus, prostate and ovary often fail to give any localizing and sometimes any general symptoms The first symptom of prostatic or renal cancer may be the appearance of a bone metastasis

Anemia and loss of weight may be the only symptoms of internal cancer, especially gastric cancer, which fails to give any indication of the location of the disease. Such cases are often treated as pernicious anemia Certain bone sarcomas are often treated for months as osteomyelitis Among 100 cases of bone sarcoma analyzed at the Memorial Hospital, only eighteen received a diagnosis of sarcoma by the first physician consulted

An interesting group of cases are those in which a tumor, benign or malignant, has been removed several years previously, but this fact has been overlooked and the symptoms of recurrence misintepreted I have several times had the satisfaction of telling a surgeon that his patient had a glass eye. Overemphasis of the fact that cancer is mainly a disease of middle life inclines physicians to reject the possibility of cancer in the case of young subjects No age is immune Thus cancer in children is nearly always overlooked until the condition is obvious I have seen a small cancer of the testis in a young man overlooked by several groups of physicians until the autopsy occurred

Many of the very rare tumors, which make up a considerable proportion of the grand total, are not suspected because the physician has never heard of such a disease

Thus the field of clinical diagnosis of cancer is extremely broad, full of pitfalls and calling for extreme alertness on the part of the physician

Résumé

The foregoing review leads to the conclusion that the diagnosis and treatment of cancer is a very difficult and exacting medical specialty While the general practitioner occupies the most responsible position in regard to cancer diagnosis, it must be admitted that without wide experience he is not able to meet the demands made upon him and that he requires the help of specialists in many fields This conclusion is no reflection on the ability of the physician Rather should we recall the famous admission of Hippocrates that "Diagnosis is difficult and judgment often fallacious"

The recognition of these difficulties has in recent years led to a world-wide movement to concentration and specialization in the treatment of cancer Hence we find that many countries are building large cancer institutes, organizing special cancer services in large hospitals and establishing group clinics in smaller communities The control of tuberculosis took the same course beginning about twenty-five years ago and there was no definite advance made with this disease until the work became specialized in all departments It seems highly probable that the same course of events will take place with cancer and that when the movement has made substantial progress we shall begin to see a reduction in the death rate from neoplastic diseases

nosis by the general practitioner becomes the most important weapon in the fight against this disease.

3 Precancerous Lesions

The number of precancerous lesions which present themselves to the alert physician is legion There is also a very large field of preventive medicine in the detection of habits and hazards which are known to lead to cancer

The Jewish ritual of circumcision has rendered that race immue to cancer of the penis Phimosis, chronic balanitis, recurrent eczema and herpes, and many other aspects of chronic irritation exist for months as an invariable antecedent of penile cancer Practically all warty growths on the penis are potentially malignant. Leukoplakia of the vulva is almost the only stage of cancer of that tissue which offers much hope of cure

The mortality of x-ray burns is still very high because the dangerous stages of these lesions are still not recognized When any x-ray burn becomes eroded, moist, infected, and repeatedly bleeding it is high time to destroy the source of danger by radical methods Most of the metastases occur when wholly unexpected, and many follow incomplete destruction by electric needles, diathermy, and fulguration

The discovery of pigmented moles on the general body surface is a simple matter, but the recognition of these lesions in unexpected sites, especially when not pigmented, requires alertness and experience Beneath the toe nail, between the toes, on the sole of foot, about the anus and vulva, in the lower rectum, and about any mucocutaneous junction, indolent ulcers or wounds should always be inspected and suspected of being melanotic

The scars of old burns are apt to develop cancer but only after a long period. Since these cancers appear usually in the scars of burns which have long been infected, the prevention of infection of burns becomes particularly important Any chronic ulcer, simple or tuberculous, may become cancerous but only after a long period Not a few cancers develop in surgical wounds, and when any of these fail to heal after a reasonable period, the suspicion of cancer should be adopted

Benign tumors usually maintain their innocence, but some of them become malignant, especially after incomplete removal. Adenomas of breast, thyroid, salivary glands, mucous membranes and other regions, should be carefully examined after removal by a competent pathologist and if there is any suspicion of malignant tendency, post-operative radiation is advisable. I have to acknowledge at least three errors in the diagnosis of benign adenoma of the breast because the excision was followed by a carcinomatous recurrence. The time to treat certain adenocarcinomatous processes in the prostate is when the tumor is early, localized, and histologically benign

The best statistical studies show that the ulcerating stomach after gastroenterostomy is no more liable to cancer than the normal stomach, and yet the excision of ulcers may remove some early ulcerating cancers which have been mistaken for simple ulcers

Laceration of the cervix uteri is a very frequent precursor of cancer, so that the repair of cervical lacerations and the correction of all forms of leukorrhea is the most efficient preventive of uterine cancer

Since cancer of the mouth is invariably the result of bad teeth, buccal uncleanliness, dental plates, tobacco, and syphilis, the physician may often be of paramount service to his patient by insisting that all these conditions be corrected promptly Leukoplakic spots in the mouth must be watched every few weeks if the outbreak of cancer is to be detected in time

Buccal hygiene in all its details is the most comprehensive of all preventive measures against cancer It affects cancer of the lip, tongue, tonsil, pharynx, larynx, nares, esophagus, and stomach, and it also protects against the danger of many other fatal diseases "La mort entre par la bouche."

Periodical examinations appear to be the only real safeguard against many forms of cancer, but the object of the examination should extend into the detection, not only of early cancer, but of precancerous lesions, and to the elimination of cancer forming habits The general physician can accomplish much by urging periodical examinations among his patients and by pointing out the danger of cancer forming habits

In certain families the hereditary influence may not be dismissed without due attention, especially in mammary cancer and neurofibromatosis Too much may not be expected, even from the most careful efforts to detect early cancers, and cancer forming habits A somewhat careful inquiry indicates

NURSING IN NEW YORK STATE

Albany, April 16—Since Governor Herbert H Lehman signed the Nurse Practice Act a few days ago, the New York State Nurses' Association has been virtually deluged with requests from practical nurses in the State for information on how they may secure licenses to comply with the new law, Mrs Ethel G Prince, president of the association said today The bill was sponsored by the association.

Because others, who have not written for information, may be interested in the requirements of the new law, Mrs Prince today issued a general statement for statewide circulation This statement outlined completely the requirements that must be met in securing a practical nurse's license.

"To obtain a license to practice as a practical nurse, each applicant must submit to the State Department of Education satisfactory evidence that he or she is more than 20 years old, is of good moral character, is a citizen of the United States or has legally declared intention of becoming a citizen, has completed the eighth grade or its equivalent and such other preliminary qualifications as the department may prescribe," Mrs Prince said "Each applicant must have completed the course of study in and hold a certificate of a school for the training of practical nurses giving a course of not less than nine months registered by the department as maintaining at the time a satisfactory standard or has completed a course of study determined by the department to be an equivalent

The applicant will also be required to pass an examination

"Any person holding a certificate as a trained attendant issued by the department may, before July 1, 1940, exchange that certificate for a license as a practical nurse. After that date a trained attendant certificate may be exchanged for a license only upon submission of an explanation for the delay

"Any person who has been lawfully and reputably engaged in the practice of nursing for the year immediately prior to July 1, 1938, who has been a resident of the state for the past year, and who meets the requirements as to age, character and citizenship, may before July 1, 1940, file with the department an application for a practical nurse's license.

"On recommendation of the examining board, the State Department of Education may license as a practical nurse the applicant provided he or she passes a practical examination The department may license a practical nurse without examination providing the applicant meets set requirements and who has practiced nursing not less than five years in the ten years immediately prior to July 1 of this year Proof of this practice must be verified by affidavits of two physicians, members of a county medical society, and it must be shown that the applicant has satisfactorily performed the duties of a nurse.

"Blanks for application for this license will be ready for distribution in the near future and persons wishing to obtain these blanks may secure them by writing to Miss Stella Hawkins, Secretary of the Board of Nurse Examiners, State Department of Education, Albany, N Y"

OBSTETRICAL PLUMBER

The old doctor was possessed of various and sundry curious bills of his plumber It seemed, the plumber's little joke in bookkeeping was being carried too far The doctor cogitated It came to pass that once upon a time his services were needed by the plumber's wife, who had come to term After all was said and done, the doctor rendered his itemized bill in kind

PHYSICIANS' HOME

"DOCTORIAL"

Containing Some Reasons for Making a Contribution or Bequest to the Physicians' Home

THE PHYSICIANS' HOME is a secure haven in an insecure world It was founded in 1918 and offers comfort, kindness, and companionship to worthy members of the Medical Profession of the State of New York

THE PHYSICIANS' HOME flourishes in the present and projects itself into the future To those indigent physicians who are our guests it is permanence in the midst of change.

THE PHYSICIANS' HOME must continue to serve It has a specific purpose, to take care of our own aged colleagues and their widows

THE PHYSICIANS' HOME has won the esteem of the Medical Profession of the State of New York This is evident by the increasing support given it by the profession during the past years It is distinctly up to us to continue to protect our own

THE PHYSICIANS' HOME has an urgent and immediate need—the demand to take additional guests We have applications from aged and worn out doctors who can no longer hope to find "the road back" They need our help

THE PHYSICIANS' HOME wants to serve that need But our present endowment allows us to accept only *one* out of ten applicants

THE PHYSICIANS' HOME has sprung from ways that are good It is a philanthropy which honors and preserves the traditions of our profession

THE PHYSICIANS' HOME requests a contribution as an expression of your faith in our tradition and our work Your continued and generous support will be appreciated

THE PHYSICIANS' HOME, through its Board of Directors, believes that to care for the aged and indigent of our own profession is a responsibility which expresses a way of life among professional people

Public Health News

The Origin of Statistics

J. Rosslyn Earp, L R C P, Dr P H
New York State Department of Health

No amount of mathematical manipulation will extract valid conclusions from records that lack validity Some of the distrust of statisticians comes from ignorance of their methods, but some is due to knowledge of the poor quality of the material with which they often have to work.

At the last meeting of the American Public Health Association, Thomas J LeBlanc, professor of Preventive Medicine at Cincinnati, read a paper on "What Should be Taught to Students in Medical Schools in Regard to Vital Statistics" He perceives that the future of preventive medicine must depend more and more upon the cooperation of practicing physicians and argues that the physician of the future must know how to be critical of statistical presentations He adds that "an understanding of the technic will make for cooperation on the part of medical men, whereas ignorance unfortunately usually leads to lack of cooperation or even active opposition" It is entirely reasonable that a busy doctor should object to filling out forms unless he believes that some useful purpose is achieved as a result of his labor

It is not difficult to see some value in the notification of communicable disease as required by Chapter II of the Sanitary Code Prompt and accurate notification of the diseases listed does more than help to determine case fatality rates It is essential to the control of community infection Yet our Division of Communicable Diseases records that recently they had the first news of an epidemic from newspaper clippings several days after the peak of the epidemic had been reached! And in another recent epidemic, attacked too late, a physician stated that he had seen 100 cases of severe sore throat in a village of 1,000 population Yet no report of an unusual prevalence of the illness had been made.

The immediate effects of such negligence are obvious enough However, the remote effects may be no less serious Theobald Smith[1] sums up a discussion of epidemiology by writing "The brief statements concerning some of the world scourges brings into clear relief the great importance of a complete knowledge of the fourth phase of the parasite cycle, that one which has to do with the transit of the parasite to fresh hosts" Complete notification is the first step in the acquisition of this knowledge. And if anyone feels abused let him comfort himself with the observation of Dr DePorte[2] that of 98,069 cases of illness studied in 1927, excluding the venereal diseases, only 3 3 per cent were in the notifiable group!

THE WOMAN'S AUXILIARY

To the Medical Society of the State of New York

KINGS COUNTY A meeting of the Kings County Woman's Auxiliary was held on April 12 at the Society Building "A Woman Surgeon" by Rosalie S Morton was reviewed by the President, Mrs. Frederic E Elliott The members were then entertained by a lecture, tour, and tea at the Brooklyn Botanic Gardens

QUEENS COUNTY A typical day in the average home was discussed by Mrs Ottilie Lynn, Child Psychologist, at the Woman's Auxiliary meeting held at the Queens Medical Society Building on March 29 At the close of the lecture, Mrs Lynn conducted an open discussion

On April 26, Mrs Caroline Hood gave a lecture on the Sky Gardens of Rockefeller Center and illustrated her talk with colored lantern slides

RENSSELAER COUNTY Dr John M Swan, a member of the State Board of Cancer Control, described recent advances made in the treatment of cancer to the Rensselaer County Medical Society Auxiliary at its March meeting Mrs Donnelly, President, introduced the speaker

The Auxiliary named Mrs Charles E Bessey as Historian and Mrs John J Carroll as Chairman of finance.

Convention News

The Woman's Auxiliary will hold the annual dinner on Monday evening, May 9 in the LePerroquet Suite of the Waldorf-Astoria Hotel All Auxiliary members and visitors to the convention are invited to attend The dinner committee are working to make this affair the real highlight of the Convention Tickets are five dollars each and may be obtained by writing the chairman Mrs John W Mahoney, 3344 Bell Ave, Bayside, or at Convention Headquarters on Sunday, May 8 or Monday May 9

* * *

The Woman's Auxiliary to the Medical Society of the State of New York will hold its Third annual convention in conjunction with the annual meeting of the Medical Society of the State of New York at the Waldorf Astoria, New York City on May 9 to 12

The third Hobby Show will be held during the four days of the convention displaying exhibits loaned by doctors, their wives or members of their families

There are now Woman's Auxiliaries in fifteen counties to draw from, so that a fine showing may be expected

Any member of an Auxiliary or of a Medical Society having an Auxiliary who knows someone who collects, makes, cooks, writes, or paints something as a hobby, or for pleasure in spare moments, please advise the president of his or her organization, as it is by this means that a Hobby Show is possible.

The President should acquaint the County Hobby Show Chairman Mrs Thomas B Wood, 878 Park Place, Brooklyn with the name and address of the Hobbyist that he or she can be invited to participate in the show Or—to be invited is not necessary—just offer the article to be exhibited

This year home-made jams, canned fruit, vegetables, cookies, candy—all will be gladly received, same to be delivered and removed by the person exhibiting, or his or her agent.

All manner of Hobbies have been offered Paintings, miniatures, carvings, knitted and crocheted articles, quilts, photographs, etchings, needle-point, glassware, early Americana, stamps and many other interesting articles too numerous to mention

To quote a poem handed in by a young doctor—

"The Hobbyist takes a delectable pride,
In showing his work to the world on the side,
And his heart swells within him, he glows in a trice
When some one in passing says 'Isn't that nice'"

* * *

One of the nicest features of our Convention will be our Tea in the LePerroquet Suite from 4 to 6 P M on Tuesday May 10 Our Host will be The Medical Society of the State of New York, our Hostess the Woman's Auxiliary to the Medical Society of the State of New York, and our Chairman Mrs Louis A Van Kleeck of Manhasset. We will be beautifully entertained by Mrs Joseph Jordan Eller who will dance for us

All meetings will be held in the Hotel, Park Ave at 50th St Rooms may be reserved now at special rates Use coupon on page xxix

employes to return to work without ng a physician, in order to avoid ig these cases to the department of , is poor economy," he said. "If his ries are aggravated by return to work itil advised by a physician, the employe nas cause for negligence action and lawyers are looking for such cases"

VOLUNTARY PAY CUTS amounting to twenty per cent of their present salaries will be taken by the five Buffalo City hospital physicians in the salary bracket above $4,500 In a letter to the Mayor, Dr Walter S Goodale, superintendent of the hospital, asserted that the physicians had agreed to take voluntary pay cuts effective with adoption of the budget for the fiscal year 1938–39 in keeping with the economy program of Mayor Thomas L. Holling

Franklin County

DR. SPENCER SCHWARTZ, a member of the staff of Trudeau sanatorium, was elected president of the Saranac Lake Medical society at a meeting on March 30 at the Ray Brook state hospital He succeeds Dr E M. Jameson Dr George E Wilson was elected vice-president, succeeding Dr Eric Richardson Dr Warriner Woodruff was reelected secretary and treasurer

The medical organization were guests of the staff of the Ray Brook hospital Papers were presented by Dr Edward Levy, Dr Mack McConkey, Dr Richard Kegel, Dr Howard Damon, and Joseph Kuring, members of the hospital staff

Genesee County

DR CLAYTON GREENE addressed the Genesee County Medical Society at a meeting on April 1 at the Hotel Richmond in Batavia, on the Diagnosis and Treatment of Common Heart Diseases

Herkimer County

DR. G J FRANK addressed the Medical Society of the County of Herkimer on April 12 on "Retroversion, Diagnosis and Treatment."

THIRTY PHYSICIANS OF Herkimer county at a special meeting on March 29 took action against a steady influx of foreign physicians

The special resolution calling for appropriate action to protect resident physicians who have spent years of their lives and much money building up a practice, was sent not only to the other county medical societies in the state, but also to the state medical society Other copies will go to the deans of medical schools and other interested persons

The fact that more than 600 foreign physicians, according to statistics in the possession of Dr James Gallo, president, were allowed to open business in direct competition with established physicians in this state in the last year, showed the seriousness of the problem

Jefferson County

DR ROBERT F GATES, seventy-seven, practicing physician of Brownsville, for fifty-three years, died suddenly on April 3 at his home. Dr Gates had followed his profession at Brownville since his graduation from medical college.

Kings County

FIFTY MEMBERS OF THE Brooklyn Academy of Pediatrics attended a dinner on March 23 at the Hotel Granada which was followed by a meeting in the MacNaughton Auditorium of the Kings County Medical Society

Papers on the "Diagnosis and Treatment of the Common Skin Diseases of Infants and Children" and "Recent Developments in Dermatology of Interest to the Pediatrician" were read by Drs George Miller MacKee and George Clinton Andrews Drs Alfred Potter, Binford Throne and Abraham Walzer led the discussion

DR ORANDO S RITCH, a trustee of the New York Medical College and Flower Hospital, who a month ago received a gold medal for sixty years of service to this institution and to humanity, died on April 12 in his home. He was seventy-nine.

Dr Ritch had been a general medical practitioner and surgeon in Brooklyn for sixty years He announced his retirement two years ago, but after five months became tired of inactivity and resumed practice.

A fellow of the American College of Surgeons, he was also a member of the American Institute of Homeopathy and of the State Homeopathic Medical Society and was surgeon at Prospect Heights Hospital

During his career he had served as president of the State and Kings County Homeopathic Medical Societies He had been connected with the Carson C Peck Memorial Hospital, Cumberland Hospital, both in Brooklyn, and the Brooklyn Nursing and Infants Hospital When he retired it was said he had attended 1,800 births without a fatality among the mothers he attended.

Medical News

Albany County

A SURVEY REVEALS THAT fifty-eight per cent of the children under five in the City of Albany have had a complete series of diphtheria immunization treatments—the highest percentage in the cities of the same population group in New York State.

Bronx County

REVOCATION OF A SIX MONTHS sentence for practising medicine without a license was stayed against Dr Vincenzo Falcone in Bronx Special Sessions on March 29 on condition that he return to Italy

Broome County

THE BROOME COUNTY Medical Society met at the Monday afternoon Club House in Binghamton on April 12 and listened to this program Dr Chas H Goodman, "History and Progress of Anesthesia" Discussion of "Surgeon's Standpoint", Dr Paul Jenkins 'Internist's Standpoint", Dr R L Hamilton

THE STATE won a victory on April 12 in a drive to regulate the practice of medicine through injunction when the Court of Appeals, in a 5-to-2 decision, ordered a Special Term of Supreme Court to hear an injunction proceeding against Earl S Laman, a Binghamton and Endicott City chiropractor

The action sought to restrain Laman from practicing as a chiropractor on the ground that his acts constituted "an open, public and continuous nuisance and will cause irreparable injury to health, safety and welfare of the people of the State"

In the lower courts the complaint was dismissed before Laman filed an answer

Chief Judge Frederick E. Crane wrote the opinion, with Judges Harlan W Rippey and Irving Lehman dissenting without opinion

Chemung County

HENRY D NILES, M D, addressed the Chemung County Medical Society at St. Joseph's Hospital, Elmira on April 6, on "Physical Therapy in Dermatology"

Delaware County

DR. RAY D CHAMPLAIN, district state health officer, addressed the dinner of the Delaware County Medical Society in Delhi on March 15 Dr Champlin discussed "Medical Service of the United States Army"

Erie County

THE BUFFALO ACADEMY OF MEDICINE on April 6 listened to a special program arranged by the staffs of Gowanda and Buffalo state hospitals At the meeting on April 13, Dr William Osler Abbott read a paper on "Small Intestinal Intubation in Health and Disease", and on April 20, Dr Henry Dawson Furniss spoke on "Office Procedures in Gynecology and Female Urology"

THE FOURTH ANNUAL SPRING clinical day of the Alumni Association of the School of Medicine of the University of Buffalo was held at the Hotel Statler on April 23, with a morning program, a luncheon, a business meeting, and a dinner The speakers at the morning session included Dr A A. Berg, Dr William F Boyd, Dr Russell L Cecil, Dr Robert A Cooke, Dr Donald Guthrie, Dr Walter I Lillie, and Dr William P Murphy

THE BUFFALO COMMON COUNCIL will be asked to curb alleged abuses of the medical services provided by the city of Buffalo for members of the Police and Fire departments, it was disclosed at the March meeting of the Medical Society of the County of Erie by Dr John C Brady, chairman of the society's committee on municipal medical care.

Declaring that policemen and firemen on the sick list receive full pay for a considerable length of time and therefore are well able to pay for medical treatment in cases that are not service-connected, Dr Brady read to the society's members the first draft of a resolution being framed for presentation to the Council

The resolution provides that no surgeon in the Police or the Fire department shall give other than emergency treatment in cases that are not service-connected Violations of this rule would be punishable by dismissal from city employ of the surgeon giving treatment and the department member receiving treatment.

The society also heard a report by Dr Carlton E. Wertz, chairman of its board on workmen's compensation, who charged that "evidence of the practice of medicine by plant nurses continues to multiply"

"Your board has explained to employers who have attended our meetings that urging

Health and Welfare in Arlington County, Va, has been appointed as Nassau County's new Commissioner of Health, for a term of six years

The new Health Commissioner's office was created by the Nassau County Charter that went into effect this year The appointment was made by the Nassau County Board of Health, of which Dr Benjamin Allison is chairman

New York County

THE ELEVENTH ANNUAL EXHIBITION of the New York Physicians Art Club will be held at the Academy of Medicine from May 9 to May 21 inclusive, 10 A M to 9 30 P M daily Painting, and work in the graphic and plastic arts by members of the Profession Reception for members and invited guests, May 7 at 8 30 P M Officers Pres Dr H A Bancel, Vice-Pres Dr S S Bauch, Treas Dr J M Hartshorre, Sec Dr Jas R Gudger

IT IS ANNOUNCED that "a doctors' orchestra is being formed under the directorship of a famous international conductor whose name is for the present withheld from publication This conductor who, as guest in this country several years ago led our first-class orchestras, has now drifted to these shores in the great exodus from the European fascist countries" For information address Leopold Glushak, M D, 1 W 85 St., New York City

DR JOHN ALEXANDER ROBINSON, otologist, formerly chairman of the section of otology of the New York Academy of Medicine, died at his home on March 24 He was sixty-three years old, a native of New York City

THE NEW YORK BRONCHOSCOPIC CLUB gave a dinner on April 13 at the Columbia University Club in honor of Dr Henry Hall Forbes, and presented to him a silver loving cup

THE TUBERCULOSIS SANITARIUM CONFERENCE OF Metropolitan New York held a clinical session on chronic pulmonary diseases on April 13 at the Cornell University Medical College Amphitheatre Speakers included Drs Emanuel Billard, Clara Regina Gross, Arthur T Robins, and Herbert R. Edwards

Onondaga County

A TESTIMONIAL DINNER was given for Dr H Burton Doust, Health Commissioner, by the Onondaga County Medical Society, on April 5, at the University Club in Syracuse The principal speaker was Dr J A Meyers, President of the National Tuberculosis Association who discussed tuberculosis

THE SYRACUSE ACADEMY of Medicine conducted a symposium on carcinoma at its meeting at the University Club on April 19 Dr Douglas Quick spoke on "Present Trends in the Treatment of Cancer"

"THE OBSTETRIC SOCIETY of Syracuse Hospitals" has been formed with Dr F J Schoeneck, President, Dr Wilbur Newell, Vice-President, Dr Glenn A Wood, Secretary, and Dr Nathan Cohen, Treasurer The next meeting is scheduled for May 10

FORMATION OF A GROUP OF Doctors' secretaries for Syracuse is in prospect

ONE OF THE TELEGRAMS of protest to Congress against the Reorganization Bill was signed by twenty-two Syracuse physicians, who feared it would be a step toward state medicine Their message read 'It is our unpurchasable and independent opinion that this disease called reorganization should be stamped out now We urge you to vote 'No' on the reorganization bill"

Ontario County

THE SECOND QUARTERLY MEETING of the Ontario County Medical Society was held at the Geneva Country Club, on April 12 "The Medical Treatment of Gastro-Intestinal Patients in Whom Surgery Has Failed" was discussed by Dr A H Aaron

Putnam County

AT THE MARCH MEETING of the Putnam County Medical Society, the speaker was Dr Max A Goldzieher, Endocrinologist Gouverneur Hospital, who addressed the Society upon the subject, "Endocrinology and the General Practitioner"

The speaker at the April 6 meeting was Dr Francis P Twinem, Assist. Urol New York Hospital, who addressed the Society upon, "Recent Advances in Urology"—*Reported by John T Jenkin, Secy*

Queens County

DR HENRY G BUGBEE addressed the Medical Society of the County of Queens on April 15 at the County Society Building on "Treatment of Prostatic Obstruction"

AT THE "FRIDAY AFTERNOON TALKS," Dr Samuel Standard spoke on April 1 on "Surgery in the Diabetic," and Dr Henry G Bugbee spoke on April 15 on "Prostatic Obstruction"

DR. LOUIS M DUSSELDORF celebrated his fiftieth year as a practicing physician in Brooklyn in March Dr Dusseldorf has made his home at 392 Union street for forty-eight years The doctor is the son of the late Dr Otto L Dusseldorf who served as physician to the Bureau of Immigration. There were four sons and the two that survive are both doctors The other son is Dr John Dusseldorf of the Parkville section of Brooklyn Today Dr Dusseldorf is being visited by great-grandchildren of patients who called on him many years ago

THE MOVEMENT IN BROOKLYN to remove the Fulton street elevated as a menace to health has been endorsed by the Medical Society of the County of Kings Commenting on the action by the Medical Society, Dr Alec N Thomson said "The streets of a great city should be sunny, airy and clean An elevated structure which throws shadows across homes, blocks air from windows and throws dust into the upper and lower floors of dwellings is hardly a health asset for any community"

Madison County

THE ANNUAL SPRING MEETING of the Madison County Medical Society was held April 14, at the Hotel Oneida, Oneida The following scientific program was presented "The Present Status of Sulphanilamide" by Dr E C Reifenstein, Sr and "Diseases of the Thyroid Gland", by Dr A B Raffl illustrated by lantern slides

Dr Mills has been engaged in revising the Constitution and By-Laws of the Society, and the first reading of that revision was made The officers have been preparing a "Speaker's Bureau" according to the plans as made at the last meeting of the Society, and a tentative program was presented

Monroe County

PAYMENT OF FEES to Monroe County physicians who examine motorists suspected of driving while intoxicated was authorized by Supreme Court Justice William F Love on March 29

The jurist's action removed the last obstacles to District Attorney Daniel J O'Mara's plan for cooperation with the Monroe County Medical Society in an active campaign to rid highways of the drinking driver menace The order directed County Manager Clarence A Smith, as acting director of finance, to pay $195 in fees owing to fifteen physicians who performed examinations during the first two months of the cooperative plan

Justice Love also directed County Manager Smith to set aside $2,800 for similar fees during the remainder of 1938, as well as $300 for payment to physicians who give testimony during trials of drunken driving cases

Although they had presented vouchers, the physicians had gone unpaid because the county failed to make provision for the fees in its 1938 budget, according to O'Mara County attorneys did not oppose a petition for the order when it was handed up to Justice Love

Under the agreement with the medical association, a doctor who examines a suspect is paid $10 for daytime examination, and $15 for one made during the night An additional $10 would be paid if he appeared in court for testimony as expert witness

Nassau County

CLOSE COOPERATION AMONG DOCTORS of Nassau county will be necessary if physicians are to guard their interests in the face of agitation for broadening the scope of socialized medicine, warned Dr Louis H Bauer of Rockville Centre, as he took over the presidential chair at a meeting of the Medical Society of the county of Nassau in the Bar association building, Mineola, on March 29

The new president forecast great changes in practice of medicine during the coming year, and warned his colleagues that "unless we stick together we will get something we don't want, for socialized medicine does not present a very rosy outlook."

He declared that doctors need the medical society, in days of sudden economic change, as much as the group needs the support of new eligible members

This slate of new officers submitted for the nominating committee by Dr Howard M Phipps of Hempstead was unanimously elected

President Elect Eugene Calvelli Port Washington
Vice President Aaron L. Higgins, Rockville Centre
Secretary Treasurer E. K. Horton Rockville Centre

Board of Censors

William C Atwell John M Quinn

DR EARLE G BROWN, a native of Kansas and former Health Commissioner of that state and at present director of Public

Hospital News

Political Interference in Hospitals

POLITICS HAS NO PLACE in anything that touches the people's health, but the sad truth about it is that "this is recognized by everybody except the less desirable type of politician"

So remarks the *New England Journal of Medicine* in telling of the attacks on the Boston City Hospital made by "pettifogging petty politicians"

Being necessarily intimately concerned with the health of the public in its more sensational aspects, it says, the Boston City Hospital has always been the target for attacks by politicians They have also tried to use its various departments as sources of reward for their creditor constituents Such an attempt was made—early in its history—to control staff appointments This, of necessity, failed and the staff has been completely free from such domination for a long time

Then the buying of supplies was tampered with. This too was corrected by impetus provided through the staff, a department of which exposed and forcibly stopped the sale of grossly infected low grade milk After the War it was notorious that the hiring and discharging of the lesser-paid employees rested in political hands, and the long, hard battle necessary to correct this evil has only recently been won

A Vicious Racket

Finally, the custom of using hospital beds, private rooms and the services of the medical and surgical staffs not only without any monetary compensation but even without the small courtesy of a "thank you" has also been stopped. This vicious racket involved politicians, their families, friends, neighbors and constituents and led directly to overcrowding, the use of the hospital facilities by those not entitled to them, the giving of false addresses by patients, and a resulting lack of efficiency in the care that the legitimate patients required.

With a strict enforcement of the rule requiring payment of hospital bills every two weeks in advance and a thorough skilled investigation before admitting all non-emergency cases, this source of petty plunder, like the staff, the purchase of supplies and the control of non-civil-service emlpoyees, has been rudely taken away

Nursing School Attacked

Only the nursing school remains as a means of granting favors It is to be presumed that the nurses have been immune from this sort of thing in the past because, in the first place, they were ladies and it is hard to bring oneself to include ladies in schemes of this sort, and in the second place, all politicians up to the present had too much self respect to stoop to such measures for the mending of their political fences However, times are hard, a new city administration is starting, and economies, including salary cuts, are in the air

Reports have it that grave evil has been done to the taxpayers by the reorganization of the nursing school at the Boston City Hospital It is difficult to understand how a reorganization that aims only to increase nurses' education and nursing efficiency, and that has been effected after prolonged and meticulous investigation by men experienced in all phases of hospital administration, can do the taxpayers anything but good

It is time to put a permanent stop to such insensate baiting The question today is not whether the nursing school at the Boston City Hospital is run well or badly That can be safely left to the Trustees and staff The question rather is, shall patients be subjected to less and poorer care than they have every right to expect because the administration of the hospital is to be hamstrung every time some minor holder of political office takes it into his head to get some publicity?

THE FIVE-STORY BUILDING at 413 West Fifty-first street, 25x100 5, west of Ninth avenue, has been purchased by St. Clare's Hospital, which owns and occupies the former St. Elizabeth's Hospital building at 415-419 West Fifty-first street.

Rensselaer County

THE AGITATION WHICH persisted with respect to the office of Troy city physician since the appointment of Dr W John Maby by a majority vote of the council Jan 3 was ended on March 13 by Dr Maby's resignation, addressed to Hawley B Harvey, commissioner of finance Immediately following the designation of Dr Maby, Commissioner of Public Safety Edward J Hunt announced that as head of the health bureau he had the appointing power, and since that time Dr J M Purcell, city physician during 1937, has been filling the duties of the office by direction of Commissioner Hunt, with the result that neither Dr Maby nor Dr Purcell received any salary After the reading of Dr Maby's resignation, Commissioner John S Moore moved that the resignation be accepted with regret, and his resolution, that Dr Purcell be appointed city physician, was unanimously adopted, and it was mutually agreed that the salary of the office for January and February be paid to Dr Purcell

DR. ARTHUR BEDELL spoke before the Biological Society of Rensselaer Polytechnic Institute on March 16, on "Photography of the Interior of the Living Eye," illustrated by photographs

AN INHERITANCE TAX REPORT filed on March 29 shows that Dr Charles H Harbinson, city health physician of Rensselaer, who died there May 3, 1937, left a gross estate of $81,169 48

Sullivan County

UNABLE TO FIND A DOCTOR in New York State who would testify against another in a Supreme Court malpractice action instituted more than two years ago, Ellsworth Baker, Monticello lawyer, told Justice Harry E Schirick on March 14 that his client, Abe Strong of Lake Huntington, had sought a medical expert in Pennsylvania and New Jersey Mr Baker revealed the situation during a calendar call, when the court attempted to clear up a number of long-pending actions If no physician who will give testimony can be found by the May term, Mr Baker consented that the case be removed from the docket.

Tioga County

THE ANNUAL POST-GRADUATE lecture course for members of the Tioga County Medical Society opened on March 23 with a dinner meeting at the Jenkins Inn, Waverly The speaker was Dr Meleny and his subject, "Bacterial Invasion of the Human Body"

Other lectures in the course included March 30, Dr James F Morton, "Puerperal Sepsis"

April 6, Dr Lloyd Tyson, "Rheumatism"

April 13, Dr Murray, "Infection of Bones and Joints"

The committee of the county society in charge of the arrangements is composed of Dr Guy S Carpenter, and Dr L J Osborne

Warren County

THE SPRING MEETING of the Medical Society of the County of Warren was held at The Queensbury on March 30 The principal speaker was Dr R H Aldrich of Boston, assistant in surgery on the faculty of the Harvard Medical School and visiting surgeon at the Boston City and Carney Hospitals His subjects was "Burns"

Washington County

THE QUARTERLY MEETING of the Medical Society of the County of Washington was held on April 5 at the Central School, Hartford, N Y The program Vice-Presidental Address, "Cavernous Sinus Thrombosis," by Dr William B Nuzzo, and "Medical Jurisprudence," by Attorney L R Lewis

Westchester County

THE GUEST SPEAKER AT THE meeting of the Westchester County Medical Society on April 19, at Grasslands Hospital, was Dr Ralph Pemberton, Professor of Medicine at the Graduate School of Jefferson Medical College in Philadelphia, whose topic was "Arthritis"

THE YONKERS ACADEMY OF MEDICINE held a regular meeting on March 16, at the Hudson River Country Club After an executive session, Dr Herman O Mosental presented a paper on "Diabetes"

THE MOUNT VERNON MEDICAL SOCIETY met on March 10, at "The Knolls" A resolution was adopted providing that the Society should have eight regular meetings each year rather than five as had previously been decided upon Two of these meetings are to be social in nature Dr Joseph F Saphir, Director of Rectal Surgery at a number of New York City hospitals, presented a paper on "Common Ano-Rectal Conditions, their Treatment with Special Reference to Local Anesthesia"

Babies "Branded" by Suntan

Branding calves is now familiar to the millions who get their thrills from the "westerns" in pulpwood magazines or in board covers Well, away out beyond, west of the "west," in the General Hospital of Vancouver, they are branding the babies, but not with the iron The trick is done with the suntan lamp Something like 1700 babies are delivered there each year, so "adequate protection to prevent them from being mixed is paramount," remarks the *Modern Hospital* The Vancouver hospital uses the nursery name necklace, but adds to it the "suntan identification system"

The name of the baby is tanned on its back through cut-out letters by a water-cooled quartz lamp This is actually done in the delivery room in the presence of the mother and before the baby is taken to the nursery

The machine is brought into the delivery room and the whole process is explained to the mother if she is able to listen Cut-out letters spelling the baby's name are set in the machine and placed against the baby's back One minute of quartz lamp treatment produces a dull reddening of the skin which shows up in a few hours and lasts usually a little more than two weeks, then gradually fades By this means the babies are definitely identified

Within a period of six months the name can be brought back to the visual field at any time by means of a special "Woods" glass which shows up the areas that have been affected by the quartz light

Parents are greatly pleased over this additional check and the mothers easily identify their own babies

One hundred of the 408 physicians and sixteen of the forty-two dentists employed by the New York department of health are said to have joined the C I O union of state, county and municipal workers

Two swastikas, facing east and west about 300 feet above the East River between Seventieth and Seventy-first Streets, on the smokestack of New York Hospital's power plant, have received the hospital's official interest and will be removed if some one will contribute $1,000

The smokestack was designed about 1927 and built before Adolph Hitler came to power The swastikas, used by many ancient peoples as a symbol long before there were any Nazis, were placed in the smokestack, with two Greek crosses, to break the monotony of the light-colored bricks The swastikas are of dark brick.

Recently a number of oral and written objections to the symbols have been received, and Dr R. R. Hannon, the superintendent, admitted that the board of directors had voted to allow them to be removed. The board, however, is unwilling to use hospital funds for the purpose.

Jamaica Hospital unveiled memorial tablets to two former attending chiefs, Dr J Evan Shuttleworth and Dr James Monroe Wicks and its former superintendent, Dr John Edward Daugherty, on April 3 Addresses were delivered by Dr Francis L Riley, President of the Medical Staff, and Howard O Wood, Esq, Vice-President of the Board of Directors, and the Rev Andrew Magill, Pastor of the First Presbyterian Church of Jamaica

Broad Street Hospital, which has been an asylum for the sick in New York's financial district since 1917, when it was founded, and has relied during that time on Wall Street charity for support, is ready to close its doors

F C Hamilton, president of the institution, which received most of its support from Henry L Doherty, filed a petition in bankruptcy on April 8 after the board of directors had authorized him to take such action

The petition explained that the directors were eager to terminate the hospital's business, wind up its affairs and sell the hospital at 129 Broad Street, as well as real estate at 117, 121, 123, and 127 Broad St. and 17 South Street, for the benefit of creditors

Four Chinese girls between the ages of six and eleven years shyly went through the ceremony of presenting $460 to Beekman Street Hospital, New York City, on April 2

Dressed in native, split-skirt street dresses and wearing their black hair bobbed and banged, the girls looked very much like Chinese dolls

The money was collected by the Chinese Chamber of Commerce to help offset the hospital's anticipated deficit for 1938 of

A Message "To Women Who Are Afraid"

A MESSAGE OF CHEERING REASSURANCE to the thousands of women who fear to visit a doctor or hospital, to find if they have cancer, is contained in a letter sent to Dr John C A Gerster, Chairman of the New York City Cancer Committee The writer says she is "*hoping this helps some poor soul*," and then gives her message thus

TO OTHER WOMEN AS AFRAID AS I WAS

I am a writer, was a newspaper feature writer twenty years, yet six years ago when the fear of cancer struck at my heart, I was as bewildered and terror-stricken as though I had come fresh from the backwoods I had noticed a growth, small but alien It did not hurt, but it would not go away I used home remedies, such as iodine, bathing with borax solution, etc., but it remained.

It happened I was not working, I had very little money I wanted a correct diagnosis, but twenty-five dollars or more to a specialist was out of the question So after suffering mentally about two months, I went to the New York City Cancer Committee. I explained that if I could get an examination at little cost, I could afford a small amount of treatment I was received sympathetically and given a card to the Memorial Hospital on Central Park West

I'll never forget the day I went there, sick at heart, wondering if I was to hear sentence of execution There I found a busy place, at least one hundred and fifty potential and regular patients My turn came. A girl took my card, assigned me to a partitioned alcove, sent in another young girl to attend me and make me ready for the physician Two physicians made the examination, then left me in the hands of the girl again.

I was shaking from head to foot, but she soothed me and then the doctor came back. "Nothing wrong," he said I could not believe it "But what is it?" I asked He laughed, "You have reached an age when possibly all sorts of strange things may happen," he explained, "but I assure you this means nothing It probably will go away just as it came." This was too much, I broke down in hysterics. He patted my shoulder "Now now surely you are glad," he laughed. "Go to a movie and forget all about it."

I offered a small amount, but it was not accepted. "One thing I want to impress on you," he said, "if at any time you are frightened again, no matter what you think is wrong, come back immediately We would rather examine one hundred persons and find nothing wrong than have just one wait too long"

I went out of there walking on air No prisoner reprieved from the hangman's noose ever felt lighter, gayer The world looked like a different place. The sky shone, the very air was alive with joy I wish I could put into every woman's heart that joy, the joy of relief But, even if the verdict had been against me, at least I had gone in time for relief and possible cure. That was six years ago and there never has been a return of the trouble.

I was saved everything, embarrassment, money, worry everything, by the kindness and the consideration of the New York City Cancer Committee. My appreciation is such that it never can be enough to express my deep gratitude But I shall do this. Any woman who is afraid, who dreads the possibility of cancer may have my name and I shall support everything I have written here. This is my contribution to try to help women overcome the dread of examination, overcome the neglect which may be serious to them Come, and learn from the Cancer Committee, either the blessed relief of having nothing wrong, or the intelligent way to combat anything that is wrong, to save yourself pain, worry, anxiety and, perhaps, death.

(Signed)

Newsy Notes

ENCOURAGED BY THE SUCCESS of the patrol established at Bradford Lord Memorial hospital at Endicott, Thomas C Holston, Endicott Boy Scout executive, is preparing to carry this work into other Triple Cities hospitals

The patrol, one of the smallest in the United States, is composed of four boys who, because of heart ailments, are unable to enjoy the strenuous life of ordinary scouting, but who wish to obtain the benefits of a Boy Scout's life.

The boys meet each Tuesday morning under the direction of Larry Price, Pine Tree district commissioner All are now engaged in merit badge work.

"If the local patrol continues its successful work," Mr Holston said, "we shall attempt to organize similar groups in Binghamton and Johnson City hospitals"

Jerome F Peck, superintendent of Binghamton City hospital, is one of the sponsors of the project, first of its kind in this section of the country

LORENZ J BROSNAN, ESQ
Counsel, Medical Society of the State of New York

Injunction To Restrain Practice of Medicine Without License

The Court of Appeals of the State of New York has very recently handed down a decision which is of great importance to all persons interested in the problem of the prevention of the practice of medicine by unlicensed persons *

The action in question was instituted in the name of the People of the State of New York by the Attorney General against a person unlicensed to practice medicine, who was charged with practicing medicine under the guise of chiropractic The specific purpose of the proceeding was to obtain an injunction primarily restraining the defendant from practicing medicine in the State of New York in violation of the provisions of the Education Law

Upon being served with the complaint the defendant moved the Court at Special Term for judgment dismissing the complaint before answering, upon the grounds that the complaint failed to state a cause of action The Court at Special Term granted the motion and the Appellate Division of the Third Department affirmed the said ruling However the Court of Appeals has now reversed the judgment of the Lower Court and has sustained the Attorney General by holding that the complaint in fact does state a cause of action.

The complaint in the action contained a detailed recital of the facts alleged and, summarized, included the following allegations The defendant had, for a period of fifteen years, maintained offices in Broome County during which time he had practiced medicine as defined in Section 1250 of the Education Law, and held himself out to the public as being able to diagnose and treat diseases, pains and physical conditions, that during that period of time he had treated a great many patients and had received compensation therefor, that the defendant lacked proper skill and knowledge for the practice of medicine and that he is not properly trained to engage in the practice of medicine, that he spent only twenty-two months in a chiropractic school and had not followed the courses of study and instruction required in the Education Law to entitle him to eligibility to engage in the practice of medicine, that in the course of giving chiropractic treatments to patients the defendant used heat and electric lamps, light rays, vibrators and ointments, that the defendant had been at no time examined, licensed or registered either as a physician, a physiotherapist or osteopath under the laws of the State of New York, but that in spite of said fact he had openly carried on his practice with full knowledge that he was violating the provisions of the Education Law and "endangering the health and welfare of the people"

The complaint also contained the following allegation

That repeated criminal prosecution of defendant for his unlawful practice of medicine, will make necessary a multiplicity of criminal prosecutions of defendant for his myriad daily acts of unlawful practice, and should convictions result at any time, the penalties provided by law would be insufficient and inadequate as to defendant and would not afford protection to the health and safety of the public as against his uninformed, unskillful, inefficient, incompetent, unqualified and unlicensed practice of medicine. On information and belief, that the continuous, habitual and intentional violation of law by defendant in practicing medicine in the State of New York without a license so to practice, and the continuous diagnosis and treatment by defendant of the diseases, pains, deformities and physical conditions of men, women and children in the State of New York in an uninformed and unskillful manner and without possessing the education, professional ability and medical knowledge required by law, has endangered, impaired and imperiled and threatens to endanger, imperil and impair the health of the public, has defeated and defeats public policy, has constituted constitutes and will constitute an open, public and continuous nuisance in the County of Broome, State of New York, and has been and will be subversive to and has caused and will cause irreparable injury to the health, safety and welfare of the People of the State of New York, and that said public nuisance cannot be caused to cease except by injunctive order in and by a court of equity

The contention of the appellant briefly stated was that the practice of medicine continued daily and threatened in the future by one who was not licensed to do so constituted a public nuisance *per se* which a court of equity would in a proper case

* *The People ex rel Bennett v Laman*, decided April 1938

$150,000 The eldest girl, Phyllis Lee, who wore an embroidered dress of lavender, read a sedately flowery message as she presented the check to Miss Gertrude Anthony, registrar of the hospital

AN ENDOWMENT OF $17,000,000 to extend the use of its present plant and enlarge its program of research and teaching is being sought by the Society of the New York Hospital and the Cornell University Medical College, Henry G Barbey, president of the hospital and chairman of the joint administrative board of the two institutions, announces

Of the amount sought, Mr Barbey said, $8,000,000 would be used for the hospital to help cover the present annual operating loss of about $1,000,000 caused by free and partly free care of patients The remaining $9,000,000 would be devoted to the medical college to strengthen the pre-clinical departments engaged in teaching and research

"No part of the $17,000,000," Mr Barbey stated, "is to be used for additional plant. It will be spent so that our magnificent buildings, modern equipment, and skillful, kindly staff may be utilized to prevent and relieve more of the city's suffering We estimate that service can be given to a materially increased number of patients with a relatively small increase in capital investment."

Improvements

THE X-RAY HOSPITAL, 10 Mt. Morris Park West (2 W 121 St.), New York City, opened on April 3 Its facilities for roentgen and radium application will be open to physicians and properly qualified roentgenologists for treatment of hospitalized patients

A REPORT IN THE *Modern Hospital* states that hospital construction contracts continued to be awarded at a heavy rate during the four weeks ending February 14 A total of sixty-two building projects were reported with costs (stated for sixty of them) totaling over $11,007,000 Since January 1 this makes a total of more than $17,500,000 of new hospital building projects announced, a substantial increase over the $10,300,000 announced during the same period of 1937 Additions to existing hospitals continue to constitute by far the most important group of building projects

Of the sixty-two plans reported forty-seven were additions and forty-five of these reported costs of just under $10,000,000 There were also nine new hospitals to cost $828,000, four alteration jobs involving a total cost of $174,000 and two nurses' homes on which it is planned to spend $183,000

THE CONTRACTORS BUILDING THE $500,000 addition to the Glens Falls Hospital expect to have it ready for occupancy early in July There will be beds for 150 patients when the hospital is completed There are at present ninety-five beds in the crowded old hospital The new section will also offer better operating room facilities, more sun porches and much more space for preparation of food and storage of supplies and equipment. Nurses will be obliged to find living quarters outside after the nurses' home is removed About twenty nurses reside in the nurses' home

At the Helm

THESE HOSPITAL OFFICIALS HAVE BEEN CHOSEN:

Arthur L. James, to be president of Flushing Hospital, reelected.

Herman S Bachrach, to be president of Trinity Hospital, Brooklyn

Dr George E Wilson, to be superintendent *ad interim* of the Will Rogers Memorial Hospital at Saranac Lake.

Mrs William P Murphy, to be president of the St. Cecilia Hospital Guild, of Brooklyn

LEO ARNSTEIN, a leader in philanthropy for more than thirty-five years, was elected president of Mount Sinai Hospital (New York City) on April 12 by the trustees He succeeds George Blumenthal, whose retirement after twenty-seven years as president and election as president emeritus were announced at a dinner in honor of his eightieth birthday on April 7

The complaint also contained the following allegation

That repeated criminal prosecution of defendant for his unlawful practice of medicine, will make necessary a multiplicity of criminal prosecutions of defendant for his myriad daily acts of unlawful practice, and should convictions result at any time, the penalties provided by law would be insufficient and inadequate as to defendant and would not afford protection to the health and safety of the public as against his uninformed, unskillful, inefficient, incompetent, unqualified and unlicensed practice of medicine. On information and belief, that the continuous, habitual and intentional violation of law by defendant in practicing medicine in the State of New York without a license so to practice, and the continuous diagnosis and treatment by defendant of the diseases, pains, deformities and physical conditions of men, women and children in the State of New York in an uninformed and unskillful manner and without possessing the education, professional ability and medical knowledge required by law has endangered, impaired and imperiled and threatens to endanger, imperil and impair the health of the public, has defeated and defeats public policy, has constituted constitutes and will constitute an open, public and continuous nuisance in the County of Broome, State of New York, and has been and will be subversive to and has caused and will cause irreparable injury to the health, safety and welfare of the People of the State of New York, and that said public nuisance cannot be caused to cease except by injunctive order in and by a court of equity

The contention of the appellant briefly stated was that the practice of medicine continued daily and threatened in the future by one who was not licensed to do so constituted a public nuisance *per se* which a court of equity would in a proper case

* *The People ex rel Bennett v Laman*, decided April 1938

enjoin in the interests of protecting the health of the people The defendant contended that there was an adequate remedy provided in the courts charged with the enforcement of the criminal law and that under the circumstances a court of equity was without jurisdiction and should not substitute its authority for the purpose of enjoining the commission of a crime,

The Court of Appeals, however, determined that upon the complaint (the allegations of which were taken to be true upon defendant's motion) the plaintiffs had set forth a proper case for injunction In so deciding the Court of appeals said in the course of its opinion

Section 1251 of the Education Law provides that

"No person shall practice medicine unless licensed by the department and registered as required by this article"

Provision is then made for the admission to examinations, the subjects of examination, the licensing and registration of those found qualified to practice. The criminal penalties are then prescribed in section 1263, quoted before. The prohibition against the unlawful practice of medicine is made without relation to the imposition of a penalty Equity is not concerned with the criminal feature of defendant's acts Another section of the statute absolutely prohibits such unlawful practice. These provisions are designed to protect the people from the ministrations of incompetent, incapable, ignorant persons, and to avoid the consequent harm to their health and physical well-being The interest of the State, the imminence of the danger and the irreparable character of the injury are here fully apparent A court of equity is not powerless to lend its assistance We have pointed out that the fact that a criminal penalty is imposed for the performance of such acts, will not deprive equity of its jurisdiction. In equity the court will consider the criminality of the act only to determine whether, under the particular circumstances equitable intervention is necessary to give adequate protection to the interest invaded or whether justice will be best served by relegating the parties to the criminal court It is not every violation of a statute, even of the statute under consideration, that calls for equitable interference. But where, as here, it is made to appear as a fact that real danger is threatened to the public health by the conduct of the defendant, that irreparable damage to the health of individuals is likely to result, and that criminal prosecution even if successful, will not give adequate protection to those in danger, a proper case for injunction has been made out. There are allegations in the complaint which charge that criminal prosecutions against defendant and others have been unsuccessful due to the reluctance of local juries to convict those defendants That is not a factor calling for equitable intervention It is no part of the office of equity to take over the duties of other public officers Nor will equity sit in judgment on the criminal courts As heretofore pointed out, equity interferes, in a proper case, not to punish the individual for his past acts, but to afford more complete protection to the complaining party by enjoining unlawful acts in the future.

In the case at bar, the People would not be entitled to an injunction upon a mere showing that the statute had been violated or that acts prohibited by the statute had been performed, in the absence of special statutory authority However, they go much farther than that They allege facts showing that the acts of defendant imperil the health of the people of the community, and will continue to cause irreparable injury to the health of the people and perhaps to their lives The relators invoke only the ordinary powers of a court of equity The power of the court to restrain acts which are dangerous to human life, detrimental to the public health and the occasion of great public inconvenience and damage is one that is possessed by all courts of equity Enough has been shown here, which if proven upon the trial, will warrant the issuance of an injunction

The status of the action following the decision of the Court of Appeals is that the defendant must answer the charges made in the complaint and the issues may thereupon be brought to trial If the charges are sustained by the evidence the Court is entitled to restrain the defendant from engaging illegally in the practice of medicine. The decision places in the hands of those charged with the enforcement of violations of the provisions of the Education Law dealing with the illegal practice of medicine a potent weapon with which to deal with unlicensed medical practitioners

Across the Desk

A Saunter Through the Medical Zoo

WHAT SORT OF BIRD is the doctor, anyway? That is perhaps what some onlookers may be asking as they view our current medical panorama—not to say melodrama or phantasmagoria This question was answered the other day by the new president of the American College of Physicians, Dr William J Kerr, of San Francisco, in his inaugural address Speaking for the College, he remarked that it was like "the lambda bird" (as reported in the *New York Post*)

"The lambda bird," he said, "can move in only one direction That direction is forward. This bird can fight only with its toes It can strike only forward with them It never kicks back

"It is to be hoped that the head may be able to keep out of the sand It is to be hoped that the head may be alert to situations developing in the country"

Here's hoping, too, that President Kerr has got his ornithology on straight, and isn't trying to put a fast one over on us Our nature-study handbook on "How to Tell the Wild Animals from the Wild Flowers" is mislaid at the moment, so we cannot verify it. However, the various quacks and fakirs who have tried conclusions with the doctors in some of the western states recently can testify to the "lam" packed in the M D 's punch, so that part of it is O K., and carries its own K.O

Low-down on Lowing Kine

Lambda, of course, is a Greek letter, and suggests the next one in its alphabet, mu, pronounced rather like "Moo," which brings to mind the lowing kine Do any of our medical friends resemble these useful but placid animals? Not any in our grand old State of New York, certainly not. No, no It is only in other states that this happens The president of a county medical society in Michigan is the one who really brought up this idea In the *Bulletin* of the Calhoun County Medical Society he comes right out and asks

"WHO WANTS TO BE A COW?"

Perhaps no group of individuals know more about the uncertainty of life than we do as Doctors The world of today reveals the rumblings and disturbances which have resulted from the reactions of certain people to the uncertainties of their own lives The results in the masses are those of apprehension and mental states that have been approximated within the memory of any man alive today

Yet, as a group, what has happened to medical men and what does the future hold?

To talk to different doctors in our own community is as enlightening as it is discouraging Each one seems so full of his own petty affairs that it is difficult to believe he is truly a part of the great social scheme. His chief concern, and rightly, too, is to make a living—to feed, clothe and shelter his family He does not, however, appear to ever hold a conference with himself to ask whether what he does for his own is all he can do or whether by adopting just a slight change in his mental processes he might do better

He accepts his lot in life and is smug over an extra house call or an unexpected small piece of business he just can't think outside of a certain groove nor in numbers larger than a successful business man would call trivial

Is there no way to impress the Doctor that the very uncertainty of his own human existence is an asset—that there are greater things, both material and spiritual, to be obtained if he can just stop thinking only as a Doctor and get a true perspective of himself and his fellows in medicine.

What can shake this smugness out of ALL the Doctors of Medicine? Do you recall the old saying "A cow is the most contented of all animals?"

Back-seaters, Come up Front!

This appeal to the back-seaters in the county society to come up front, shed their calm and their coats, and lend a hand, was spotted and sent in to this department by a prominent member of the Council of our own State Society It is timely gospel, and fits like a glove the member who takes as his life motto "Let George do it." Organized medicine is facing what may be the big crisis of its history, and has no room for the purely ornamental member or chair-warmer, such as is described by Thackeray

> "He was more than usual calm
> He did not care a single damn"

It must be said that the succession of

bad bumps and jarring jolts received by the foes of honest medicine around our fair land in recent years indicates that the medical leaders, anyway, have their fighting clothes on, and appear free from any infection of the sleeping sickness germ If they have any bovine qualities, they seem to come from the gentleman member of the family, who knows how to toss intruders over the fence on a sharp pair of horns.

A New Club of Old Members

An interesting club is being formed by the Illinois State Medical Society It is called the "Fifty Year Club," and is made up not only of members who have completed fifty years of practice, but also of any non-members of equal service recommended by the medical societies of their counties It is expected that the membership may reach around 200 What a wealth of medical and human experience, wisdom and reminiscence will be brought together in this club passes the imagination The committee in charge is already canvassing these golden-jubilee practitioners to find and preserve information about the highlights of their careers, and it is not too much to aver that Illinois is on its way to having a unique and invaluable collection of historical medical lore

One doctor began practice in 1872 Another has had a large "boat practice" along the waters of southern Illinois Our way of living has probably been more radically transformed and revolutionized in the past fifty years than in any other equal time in the history of man, and these grand old men of medicine are slipping away quietly but rapidly week by week, as noted on other pages, their recollections lost forever What a "slice of life" these veterans can give is seen in Dr Macartney's vivid book, noticed in this department a few weeks ago "Every man has a book in him," they say—we have Dr Macartney's, why not go after some of the rest?

Homes for Homeless Doctors

Lifting the sights of our telescope, we range a couple of thousand miles further, to California, and find a movement on foot there to encourage the county medical societies to build homes of their own. Societies of more than 100 members are especially urged to have permanent quarters, nothing more, at the start, perhaps, than a meeting-room arranged for use as a library and social club The woman's auxiliary could lend a hand in making it homelike The possession of its own headquarters adds to the prestige of any society and stimulates its growth and *esprit* Arrangements can be made with the Federal Home Loan authorities to finance the undertaking to a large extent, and the sums now paid in rent could go to help the new enterprise. In Los Angeles every applicant for membership in the county medical society must pay, or sign a note to pay, one hundred dollars into the permanent quarters fund As a result, it has a fine headquarters and library building Smaller societies have attractive bungalows The editor of *California and Western Medicine* closes his editorial on this topic by saying, "Where there's a will there's a way," and while he is no doubt referring to the vim and vigor of the living, his phrase suggests that the last will and testament of some friend of the profession might help a lot, too

Sinister Side of State-run Medicine

The Nazi government, according to "extremely reliable sources" quoted in *The News Week* (Feb 21) has instructed doctors that deformed or abnormal babies are not to be brought into the world. "As a medical man, you will know how to prevent the child taking life, and what to explain to the mother" Which is of more menace to the world, physical deformity or a mental and moral twist? One is to be denied life, the other may grow up to seize the reins of power, mislead a nation, and plunge the world into war

It takes hardihood to set up as a judge of who shall live, and who not, and the one who lightly assumes such a responsibility might well remember the words "Judge not, that ye be not judged"

REVIEWED

Diseases of the Blood and Atlas of Hematology With Clinical and Hematologic Descriptions of the Blood Diseases Including a Section on Technic and Terminology By Roy R. Kracke, M D, and Hortense E Garver, M S Quarto of 532 pages, illustrated Philadelphia, J B Lippincott Company, 1937 Cloth, $15 00

Within the past year several excellent works on hematology have been published Kracke and Garver *Diseases of the Blood and Atlas of Hematology* is one that merits first rank position It is a most comprehensive work which is divided into the following sections I, Hematologic terminology, II, Development and Morphology of Blood Cells, III, Leucocytosis and leukopenia, IV, the Anemias, V, the Leukemias, VI, Hemorrhagic Diseases, VII, Miscellaneous In the last are included such important subjects as Infectious Mononucleosis, Polycythemia Vera and Malaria, discussed as diseases, the bone marrow, blood groups and transfusion and the blood picture of normal laboratory animals Section VIII is devoted to hematologic technique.

It is indeed unfortunate that the author titles this excellent work as "diseases of the blood", especially since such emphasis is placed in medical teaching that the diseases are really of the blood producing tissues The author discusses terminology critically, but introduces a system of his own as do other authors also One must admit, however, that it appears attractive and logical The glossary of hematology is particularly valuable. Yet a reviewer must be exceptionally tolerant in so controversial a field as hematology, and therefore, should not call attention to statements with which he does not agree This is especially true here, since in no field is there greater individualism The text is profusely amplified by tables, charts and most excellent illustrations The blood pictures are finely and accurately reproduced in natural colors, and accompanied by legended schematic maps After each section is a discriminately selected list of references The volume is replete with hematologic information, and should be of inestimable service to the clinician and laboratory worker

MAX LEDERER

Crippled Children, Their Treatment and Orthopedic Nursing By Earl D McBride, M D, and Winifred R. Sink, R N Second edition Octavo of 379 pages, illustrated St Louis, The C V Mosby Company, 1937 Cloth, $3 50

It is not infrequent to have a request from training schools for a suitable textbook on orthopedic nursing To meet this demand there have been in the past fifteen years, some few contributions in book form This particular work first appeared in 1931, and met with considerable favorable comment. The collaboration of an orthopedic surgeon and a registered nurse, both of whom have had particular contact with the crippled child, is to begin with, an excellent combination In this second edition they have covered the field thoroughly The volume contains many practical suggestions for the doctor as well as for the nursing profession The text is attractive reading, clear, and concise The illustrations are commendable It is a volume that should be available in the libraries of all training schools

DONALD E MCKENNA

The Betty Book. Excursions into the World of Other-Consciousness Made by Betty between 1919 and 1936 Now recorded by Stewart E White Duodecimo of 302 pages, New York, E P Dutton & Company, 1937 Cloth, $2 50

This book, as its subtitle implies, is an excursion into spiritualism It deals with an account of the experiences of one called "Betty" who is regarded as a psychic, and with the communications received by her from the invisibles The author attempts to make a case for spiritualism and apparently is a great follower of that movement.

To one who deals with life's realities and to one who is interested in mental hygiene, this book will have little appeal On the other hand to those who delve into spiritualism and similar allied subjects the book should prove of considerable interest.

IRVING J SANDS

Sex Life in Marriage. By Oliver M Butterfield, M A Duodecimo of 192 pages, illustrated New York, Emerson Books, Inc, 1937 Cloth, $2 00

The title of this little volume at once gives an idea of the contents In its pages may be found the answer to many sex problems, and what is more important, a careful application of these answers will prevent many of the problems from ever arising

There are many books on sex life being published This volume is written by one who is eminently capable because of his long experience as a marriage councilor, and his previous experience in the writing of *Marriage and Sexual Harmony*

This small volume is certainly one of the better books on sex, and all those who wish to learn the real facts will gather much knowledge by a study of its contents

WILLIAM SIDNEY SMITH

Wheeler and Jack's Handbook of Medicine Revised by John Henderson, M D Tenth edition. Duodecimo of 703 pages, illustrated Baltimore, William Wood & Company, 1937 Cloth, $4 00

In this edition the section on the anemias and parts of the section on gastric disorders have been rewritten It is still a small volume, slightly larger than its predecessor To the physician it is chiefly useful for hurried reference, and to the medical student for review purposes It has found a place for itself since the first edition of 1894

WILLIAM E MCCOLLOM

The Management of Fractures, Dislocations, and Sprains. By John A Key, M D and H Earle Conwell, M D Second edition Quarto of 1246 pages, illustrated St Louis, The C V Mosby Company, 1937 Cloth, $12 50

This second edition is an excellent volume on the subject It is clearly written, well illustrated, and treatment is so detailed as to be easily understood The orthopedic phase of fracture work is discussed in more detail than is usual in such works, and the traumatic aspect of such injuries is well covered The medico-legal risks are plainly set forth in the chapter on that subject, and this is an invaluable aid for both practitioner and specialist No one doing fracture work should be without this knowledge.

The section on Injuries in the Region of the Hip has been expanded, and new illustrations added The subject of Fractures of the Neck of the Femur is very well covered, and stress laid upon the operative treatment of such fractures in a full discussion of this phase of fracture work. The chapters on Fractures of the Skull and Brain Trauma are fine, as well as the one on Fractures of the Jaw and Face.

This work is an excellent text for student, practitioner or specialist.

Hospitals and Sanitariums

INSTITUTIONS SPECIALIZING IN TREATMENTS

Selecting the Institution

For patients requiring a little more specialized care and treatment than the regular or general hospital is able to provide, the task of selecting a private hospital or sanitarium is far too important to be treated in a cursory manner

There may be hundreds of sanitariums or private hospitals equipped to treat some specific disorder, yet not all can be equally suitable to every patient with that disorder Natural and created elements become serious factors when entering a patient into an institution.

For one thing rates vary Environment differs, even though much thought is given to this when an institution is established Regimen varies Some institutions may have features beneficial to one particular patient, but of less value to others

In some cases, the homelike atmosphere might be indicated, in other, something less reminiscent of home. Some patients might be the better for a place with a lot of activity, while others would improve faster under isolated and quiet conditions It is possible to enumerate many more points that signalize the suitableness of one sanitarium or private hospital over another

But sufficient is the evidence to establish the wisdom of personal study and classification of sanitariums and private hospitals by the physician himself His reference file should contain all the available data pertaining to a sufficient number of institutions to adequately diagnose the patient's suitability for the institution and the institution's fitness to care for the patient

Every sanitarium or private hospital in this section will be only too pleased to furnish any of the above information or any additional data the physician might desire.

Camping for Children Physically Handicapped

Now when it is time to begin thinking about camps and the benefits of the great outdoors for children—what about those with permanent or temporary physical defects who would not be happy in the usual camp?

It is especially for these that Brooknoll Manor was created—an unusual camp attuned to the physical atypical child.

Situated on the beautiful Nachaug River, in Connecticut, it is completely isolated with brooks running through woodlands and forming natural pools before joining the river A slight elevation of 500 feet offers climatic advantages ideal for Brooknoll's purpose.

The camp is unusual for its special buildings planned in conjunction with the Medical Advisory Board Each bungalow is modern in every way and has a playroom for rainy days Weekly reports are made to the child's family physician Health certificates are required from the staff as well as from the campers, and the number of campers are limited to assure individual and constant guidance.

The camp has a complete infirmary, an advisory board of prominent physicians and psychologists, experienced resident physicians with National Board registrations, experienced pediatric nurses, resident psychologist and graduate dietitian, as well as counsellors who are college graduates with special training

To the physician who has a physically handicapped child patient—"Brooknoll Manor" is the answer to a happy and beneficial summer for that child.

DEAR DOCTOR,

There's a spacious white ship, The Monarch of Bermuda, anchored in New York harbor . . waiting to skim you over the blue Atlantic on a special 6-day cruise to Bermuda . . island of coral beaches and flaming sunsets . . . island of golf and tennis, of bicycles and horse drawn carriages . . island of romance and glamor where the cares of the world slip away like a discarded garment. And you *can* get away! Because you'll be in New York for the 132nd Annual Meeting of the New York State Medical Society, May 9 to 12 . . just extend your vacation another 6 days . You'll come back refreshed . . . robust . . ready to work harder than ever . . . The cost is little; this is a SPECIAL CRUISE FOR DOCTORS ATTENDING THE CONVENTION . rates are lowered as much as 10% to 30% . . . Plan now to sail away to this enchanted island the day after the Convention.

By the way—"Santa Fe"

Just a tip on the luxury you'll enjoy travelling "Santa Fe" to the A.M.A. Convention in June

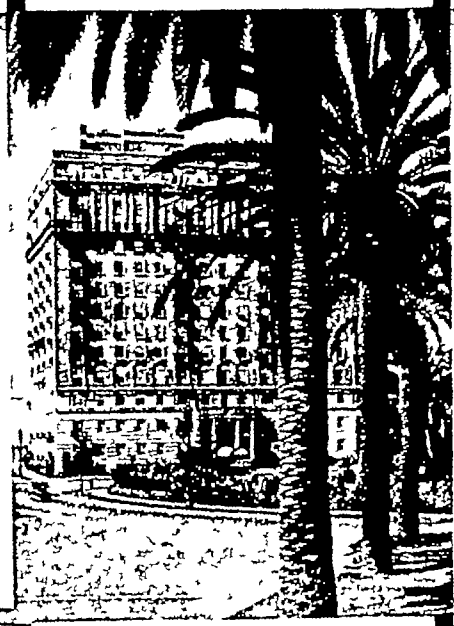
The Atchison, Topeka and Santa Fe Railway System traverses the heart of romantic America—the land of the conquistadores and padres, the pathfinders, traders and pioneers

Some of the most remarkable scenery in the world is found on its lines, and in the vast frontier hinterland to north and south

Santa Fe tracks tap the most fertile farming sections of the United States, and regions rich in mineral wealth

These three statements briefly describe the country you cross while journeying from Chicago to California But they are only generalities Many pages would be needed to tell in detail the sights that may be seen along the Santa Fe, from the agricultural districts of Illinois, Missouri, and Kansas to the Rockies of Colorado, the picturesque Indian pueblos of New Mexico, the geological marvels of Arizona and the old missions of California

To mention but one—the Grand Canyon of Arizona is a gigantic chasm 217 miles long, 4 to 18 miles wide and a mile deep At its bottom, a mighty river, the Colorado, rushes to the sea. Rising from its depths are whole ranges of mountains, their tops only slightly below the rim of the gorge. Over the rock temples and into the depths of the chasm spreads a sea of ever-changing colors



The more than two and a half million people who have seen the Grand Canyon know the futility of trying to describe it. It slashes a wilderness plateau for over 200 miles, it is fed by scores of side canyons which are only less incredible than itself Only the merest fraction of it has ever been trodden by the foot of man. It imprisons one of America's great rivers so completely as to make it invisible from above, except where here and there the sun flashes on the rock-torn rapids

Compare the Santa Fe in 1935 with the road in 1870 It now has an operated mileage of 13,259 miles, then only 42 miles For the year 1935 the gross operating revenue was $135,686,392, then only $182,579 For the year 1935 freight earnings were $109,685,780, passenger $13,447,074, and miscellaneous earnings $12,553,538 For the year 1935, 25,767,496 tons of revenue freight and 2,263,197 passengers were carried, while in 1870 the respective figures were 98,917 tons of freight and 33,628 passengers Now the rolling stock consists

Early reservations at the FAIRMONT will assure your maximum enjoyment of friendly, fascinating San Francisco

★

GEORGE D SMITH, *Manager*

The FAIRMONT Hotel

of 1,756 locomotives, 82,613 freight cars and 1,493 passenger cars while in 1870 it was but 6 locomotives and 141 cars

Total investment in road and equipment, December 31, 1935, was $1,131,995,500 Total capitalization, including common and preferred stock and funded debt, was $676,532,062. Holders of common stock numbered 39,049 and of preferred stock 18,243

Average number of employes in 1935 was 41,429, and average annual compensation $1,660.22—total yearly pay amounting to $68,781,299

Santa Fe federal, state and local taxes for the year 1935 aggregated $10,476,179

These figures are impressive as showing the growth of this great transcontinental system from a small beginning in one state to present trackage in twelve states

Back of a big undertaking one always finds big men Among those who helped to make the Santa Fe, six men deserve preferred mention—C K Holliday, promoter, first president and for thirty-seven years a director, A A Robinson, chief engineer and vice-president, Wm B Strong, president from 1881 to 1889 E P Ripley, president from 1895 to 1920, W B Storey, president from 1920 to 1923 and S T Bledsoe, now president.

The Atchison & Topeka R R Co was chartered by the Kansas territorial legislature February 11, 1859, and organized September 17, 1860 By act of Congress, accepted February 8, 1864, the state of Kansas was granted about 3,000,000 acres of land for the building of this railroad, as compared with 26,000,000 acres and $61,000,000 cash given another cross-continent line. This tract consisted of odd-numbered sections, mainly in Arkansas Valley, in a strip 335 miles long and averaging from 20 to 40 miles in width, between Cottonwood Falls and Kansas-Colorado state line.

Ground was broken in November, 1868, for construction of the Atchison, Topeka & Santa Fe R R. First train ran from Topeka to Wakarusa in April, 1869 The road reached Carbondale June 17, 1869, Emporia in August, 1870, and Newton in 1871 In spring of 1872 trains were first operated between Topeka and Atchison, also between Newton and Wichita Construction from Newton west began May 1, 1872, the "end of track" being, in succession at Hutchinson, June 17, Great Bend, August 5, Larned, August 12, Dodge City, September 9, and State Line, December 28 of that year—or 360 miles of new track in eight months Granada, Colo, was reached by May 10, 1873, and Las Animas, September 13, 1875 Early in October, 1875, the line from Kansas City to Topeka was acquired. Pueblo was put on the Santa Fe map March 1, 1876, and Denver soon afterwards

Following dates show progress through New Mexico Las Vegas, July 4, 1879, Santa Fe, February 9, 1880, Albuquerque, April 15 1880, San Marcial, October 1, 1880, and Deming, March 8, 1881, connecting at latter

How About Yourself, Doctor?

AS a change from recommending a change to others, how about a change for yourself?

Who needs it more than one who is continually called upon to contemplate sickness and suffering?

Perhaps, true to medical tradition, you have scruples about prescribing for yourself, so permit us to write a prescription for you!

Take a little time off occasionally at Atlantic City and give body and brain the benefits which you and other members of your profession so freely recommend to others

Try some of your own medicine, Doctor! rest, quiet and salt air, bracing, appetizing days, and nights tranquil with the heavy honey dew of slumber!

"I NEVER KNEW YOUR PRICES WERE SO REASONABLE"

So exclaims many a Campbell patron who, until urged to investigate, had labored under the impression that Campbell service is expensive In fact, many of the funerals we conduct total less than $200 complete

FRANK E. CAMPBELL
THE FUNERAL CHURCH, Inc.
Broadway at 66th St Phone TRafalgar 7-8200

point for California El Paso, Texas, became the southern terminus, June 11, 1881

Construction started on Atlantic & Pacific R. R, west of Albuquerque, in summer of 1880 By the spring of 1882 track was laid to Canyon Diablo, Ariz, and in August, 1883, as far as Needles, Calif Late next summer, the line from Needles to Mojave was added. Meanwhile the California Southern Ry had been built from San Bernardino to National City, and late in 1885 the gap was filled between Barstow and San Bernardino, with entrance into Los Angeles

During May, 1886, the Gulf, Colorado & Santa Fe Ry was taken over Another important undertaking was the extension from Kansas City to Chicago, through trains being put on in the spring of 1889

Then, in May, 1900, the new line of the S F & S J V Ry was operated from Bakersfield to San Francisco

The latest acquisitions comprise the line south of Ash Fork, bought in July, 1901, the Belen Cut-off, opened July 1, 1908, the Parker Cut-off, opened July 1, 1910, and the Coleman Cut-off, completed March 1, 1914 In 1928 the Santa Fe acquired the Kansas City, Mexico & Orient Ry

Along with these new main lines numerous branches were built, as feeders, thereby rounding out the system as it is today

Specialists . . .

We specialize We do a lot of business with physicians and surgeons. We believe we know what kinds of wines and liquors you like and that you like them quickly (and inexpensively) We give special attention to prescription orders—sherries, ports, other wines, and spirits. We deliver to office, home, or hospital—to any point allowed by law We invite inquiries.

HEADINGTON CORP.
Fine Wines & Liquors at Retail
1133 Lexington Avenue New York, N Y
Telephone BUtterfield 8-4850

At 20 division points the Company maintains reading rooms and club houses for employes They are stocked with daily papers, periodicals and books, and most of them have sleeping quarters Another feature is free winter entertainments furnished employees and families Average daily attendance 2,000, maintenance cost approximately $70,000 yearly

Apprentice schools, also schools for teaching telegraphy, telephoning, station agents' duties, etc., are provided.

The Santa Fe has liberal pension plan for its employes, maintained wholly at the Company's expense Payments under the plan during the year 1935 amounted to $1,085,475

The Santa Fe is the only railroad between Chicago and California under one management all the way It is double tracked nearly the entire distance and safeguarded by block-signals the entire distance Fred Harvey manages the dining car, dining-room, lunch-room, and hotel service. And the Santa Fe is the only railroad to rim of Grand Canyon National Park, earth's greatest scenic wonder

It is interesting to note that the route of the Old Santa Fe Trail, also of the National Old Trails Auto road, closely parallels the main line of the Santa Fe Railway through Kansas, Colorado and New Mexico

℞

FOR COMFORT AND CONVENIENCE IN NEW YORK

SYSTEMIC TREATMENT

for

GONORRHEA
PROSTATITIS
CYSTITIS
VESICAL CATARRH
PYELITIS
PYELONEPHRITIS

Consistently successful clinical results are favored by the administration of Sesquiterpenic Alcohol, the active principle of sandalwood oil

Prolonged

IODINE MEDICATION

without

TOXIC EFFECT

The problem of how to administer effective iodine medication over extended periods without subjecting your patient to iodine disturbances, is successfully solved for you by the use of

ARHEOL

(ASTIER)

Purified Active Principle of Sandalwood Oil

ACCEPTED AMERICAN MEDICAL ASSN Council on Pharmacy and Chemistry

RIODINE

(ASTIER)

Organic Assimilable Iodine

Arheol, a standardized unchanging preparation, is essentially all sesquiterpenic alcohol, containing never less than 98% of *santalol*
Uniformly prompt and dependable
Undesirable sequelae frequently associated with sandalwood oil therapy absent or reduced to a minimum

An iodine addition product of castor oil containing 17% of iodine
Insures maximum utilization of iodine with minimum dosage Retention time of iodine in the body with Riodine is double what it is when using potassium iodide

Marketed in pearls *There is no spilling, no measuring, no bad taste*

Gallia Laboratories, Inc., 254-256 West 31st Street, New York

Are the Neuritic Symptoms of Pregnancy *due to a deficiency of vitamins B1 and G?*

SUCH common neuritic symptoms of pregnancy as pains in arms and legs, muscle weakness, and (less frequent but more serious) paralysis of the extremities may result from a shortage of antineuritic vitamins, recent investigations appear to show Although neuronitis of pregnancy has long been considered a toxemia, no toxins have ever been identified

Clinical observations of Strauss and McDonald lead to the conclusion that the condition is a dietary deficiency disorder similar to beriberi, caused by lack of vitamin B_1, complicated by symptoms which may be traced to shortage of vitamin G They report recovery in their cases receiving this therapy, including dried brewers' yeast

Hyperemesis as Cause of Avitaminosis

Wechsler observes that all cases of polyneuritis of pregnancy recorded in the literature were preceded by long periods of severe vomiting "It would seem," he adds, "that because of actual starvation these patients suffered from avitaminosis and consequent neuritis," a view likewise held by Hirst, Lukart, and Gustafson Plass and Mengert observe that the practice of giving high carbohydrate feedings for hyperemesis gravidarum is still more likely to cause avitaminoses B and G

oDried brewers' yeast as it is far richer than any other food in vitamins B_1 and G is being used with benefit both in the prevention and treatment of polyneuritic symptoms of pregnancy Lewy found that additions of yeast to the diet reduced electric irritability of the peripheral nerves and brought clinical improvement Vorhaus states that he and his associates, after administering large amounts of vitamin B_1 to 250 patients having various types of neuritis, including that of pregnancy, observed in about 90% of cases "varying degrees of improvement, i e , from partial relief of pain to complete disappearance of all symptoms

Need for Vitamins B and G in Lactation

Evans and Burr Hartwell, Sure and co-workers and Macy *et al* are among numerous authorities who find that the nursing mother also needs supplements of vitamins B_1 and G from 3 to 5 times the normal requirement. Tarr and McNeile report that the physical, mental, and emotional status of 120 pregnant and lactating women receiving Mead s Brewers Yeast and other foods high in vitamin B was superior to that of a control group of 116 women

Since the management of polyneuritis of pregnancy is difficult at best, it would appear logical to supply those dietary substances which may safeguard against it. One of the richest and most convenient sources of the anti-neuritic factors, vitamins B1 and G, is Mead s Brewers Yeast Tablets. Consisting of nonviable yeast, they offer not less than 25 International vitamin B1 units and 42 Sherman vitamin G units per gram.

Supplied in bottles of 250 and 1,000 tablets, also in 6-oz. bottles of powder

Please enclose professional card when requesting samples of Mead Johnson products to cooperate in preventing their reaching unauthorized persons

Mead Johnson & Company Evansville Indiana U S A.

COLLOIDAL MERCURY SULPHIDE—HILLE

Is Painless on Injection, except for the prick of the needle

The colloidal mercury sulphide to which the published bibliographies usually refer, and the only colloidal mercury sulphide accepted by the A M A Council on Pharmacy and Chemistry

Normal dosage represents a cost of only a few cents per injection The economy feature, aside from the efficacy, impresses physicians most favorably

LUNOSOL (Colloidal Silver Chloride Compound) another Council-accepted Hille product Sample on request

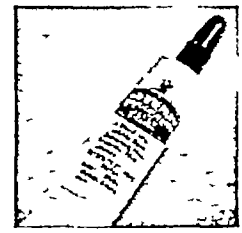
Clear the way
for free breathing in COLDS

The congested nasal mucosa and the hypersecretion in colds can be efficiently brought under control by topical application (dropper, spray, pack or jelly) of the synthetic vasoconstrictor—

NEO-SYNEPHRIN
HYDROCHLORIDE
(laevo-alpha-hydroxy-beta-methyl-amino-3-hydroxy-ethylbenzene hydrochloride)

The action of Neo-Synephrin occurs promptly after its application, and is of prolonged duration. Additional advantages include

—freedom from sting
—more sustained action than epinephrine or ephedrine
—less toxic in therapeutic dosage than epinephrine or ephedrine
—stability—may be sterilized by boiling
—in dosage recommended, Neo-Synephrin does not usually produce 'nervousness' or insomnia



3 Convenient Forms—

Neo-Synephrin Hydrochloride Solution
¼% and 1% (1-oz. bottles)
Neo-Synephrin Hydrochloride Emulsion
¼% (1-oz. bottles)
Neo-Synephrin Hydrochloride Jelly
½% (in collapsible tubes with nasal applicator)

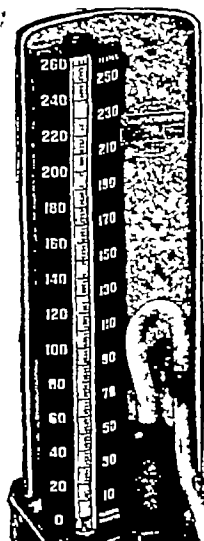
BUFFERED ALKALINIZATION
by the safe, physiological process

WHERE buffered alkalinization is desirable—as during sulfanilamide administration, in the treatment of colds, influenza and other seasonal respiratory affections—Kalak offers these clinical advantages

(1) It presents a balanced combination of bicarbonates in solution. (2) It contains the mineral substances normal to the blood (and no other)

Kalak's high buffering value helps to maintain the urinary pH of 7.4 which has been found so desirable in sulfanilamide therapy



KALAK
is synthetically prepared—is hypertonic, uniform in composition, definite in alkali potency

✓ INSPECTED
✓ PROTECTED *Milk*

BACKING up periodic "surprise" inspections at the farm, and *daily* routine inspection of *every can* of milk at the receiving plant, DAIRYLEA MILK is subject to still further checking. Smears are taken of milk at different points in the plant Other smears are taken of all milk marked for microscopic examination by the receiving inspectors

Nothing is left to chance DAIRYLEA MILK has to be good to pass these interlocking checks and re-checks.

All DAIRYLEA milk products are inspected-protected They are safe foods for doctors to recommend

✓checked and ✓re-checked by bacteria counts when indicated . . .

Microscopic appearance of high grade, gravity-formed cream No bacteria present even though the milk stood at room temperature for 30 hours before the cream smear was made.

DAIRYLEA *Milk*

Our Pledge: We, the farmers of the Dairymen's League, recognize a definite obligation to the public Since milk is nature's most nearly perfect food, we pledge ourselves, in the production of Dairylea Milk Products, to do everything within our power to safeguard their purity and quality

The Dairymen's League Co-operative Assoc., Inc.

is sold in BUFFALO under the trade name, Weckerle
is sold in the TROY area under the trade name, Cloverleaf

milk

an alkaline-ash food, important in preserving the acid-alkaline balance of the system

IT is a well-known fact that proteins, fats and sugars are constantly forming acids as end-products of their metabolism. In order to maintain the proper acid-alkaline balance of the system, the mineral alkalis must be counted on to balance these acid-forming foods

Milk, green vegetables and fruits are three of the most valuable alkaline-ash foods because of their calcium, potassium and sodium salts content. Milk is especially valuable because of its high calcium content

In its campaign to increase milk consumption among adults the Bureau of Milk Publicity of the State of New York is calling attention to the fact that milk is an alkaline-ash food, and so valuable in helping to maintain the acid-alkaline balance of the system *The Bureau of Milk Publicity, Albany*

SCARLET FEVER ANTITOXIN (NATIONAL)

A Real Achievement in Concentration and Refinement.

Refinement and concentration of the globulin fraction reduces the volume and decreases serum reactions because of low content of non-essential serum proteins

Lessens pain of injection
Smaller volume is more quickly absorbed
Gives quicker therapeutic response

PROPHYLACTIC DOSE
2,000 Units National Inst of Health (100,000 original neutralizing units)

THERAPEUTIC DOSE
6,000 Units National Inst of Health (300,000 original neutralizing units)

Each prophylactic and therapeutic dose contains an excess of units to insure potency beyond expiration date stamped on each package Furnished in sterile syringes, with rustless (chromium) steel needles and adaptor

The advantages of a highly refined and concentrated Scarlet Fever Antitoxin should materially increase its use for prophylaxis (passive immunity), and for the treatment of scarlet fever patients

Write for literature on Scarlet Fever Dick Test (Skin Test Toxin), Immunizing Toxin for active immunity and Antitoxin (National)

CONTROL is the Measure of Reliability

Microphotograph of rachitic bone of white rat to be used for Vitamin D testing.

Note the progress of recalcification due to Vitamin D The Johns Hopkins Line Test is the basis for determining potency

AFTER extensive and unremitting clinical work have clearly demonstrated the therapeutic and prophylactic values of a product, its constant reliability depends upon the rigidity of the standards of the control work which insure its unvarying uniformity

Foundation-licensed products are subjected to ceaseless checking for Vitamin D potency so that they may always merit the complete confidence of the medical profession

In a single year 20,000 white rats are used to test the products of reliable pharmaceutical houses, food manufacturers, dairies and evaporated milk companies licensed to use the Steenbock Irradiation Process 5,000 additional animals are used by associated laboratories who assist in the huge task of maintaining the standards of Vitamin D products

Other thousands are used in bio-assays by the licensed companies In their plants standardized production methods alone result in uniform quality of product that is further safeguarded by the licensees' own bio-assays

Uniformity of product is an indispensable factor in obtaining uniformly satisfactory results To that end the Foundation and its licensees continue to work in order to provide broad protective measures against Vitamin D deficiencies

Licensed Irradiated Vitamin D Products

To identify Foundation licensed products look for the word Irradiated or the name of the Wisconsin Alumni Research Foundation. The Foundation licenses only products of definite benefit to mankind, assures rigid control and standard Vitamin D potency Select from the list below

VIOSTEROL and Viosterol Fortified Pharmaceutical products of Abbott—Mead Johnson—Parke, Davis—Squibb—Winthrop

MILKS Irradiated Evaporated Milk; Irradiated Vitamin D Fluid Milk; Metabolized Vitamin D Fluid Milk; Dryco Powdered Milk.

FOODS Other Vitamin-D enriched foods include. Milk Drink Accessory Foods and special products.

TOMATOES or TABLETS

HOW DO YOU PRESCRIBE *Calcium?*

TOMATOES are a good source of Vitamins A, B, and C—but they contain only traces of Vitamin D and so little calcium that a patient would have to eat 11 pounds daily, if this food were used as the sole source of the minimum calcium requirement

Obviously no physician would impose such a diet upon his patients to assure sufficient calcium for the normal development of bone structure An authority* has shown that many other foods in the ordinary diet are equally poor sources of calcium and Vitamin D

For cases requiring calcium (particularly growing children and pregnant and lactating women) many physicians prescribe a dietary supplement, such as Dicalcium Phosphate Compound with Viosterol Squibb This product not only supplies the necessary calcium and phosphorus, but also ample Vitamin D to assure their proper absorption and utilization

Dicalcium Phosphate Compound with Viosterol Squibb is supplied in tablet and capsule form One pleasantly flavored tablet—or two capsules—contains 2 6 gr calcium, 1 6 gr phosphorus, and 660 units of Vitamin D (U S P XI)

The capsules are useful as a change from tablets, or during pregnancy when nausea tends to restrict normal food intake The tablets are available in boxes of 51 and 250, capsules in bottles of 100 and 1000

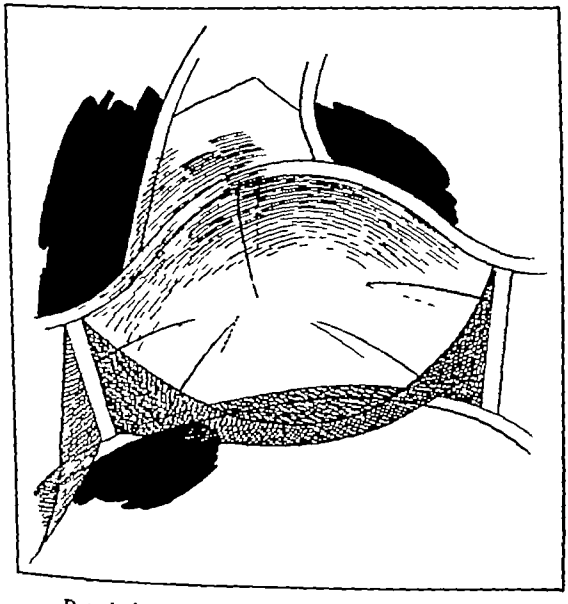
BREAST SUPPORTS

An author* in the current medical literature, after reviewing the histories of 518 patients with carcinoma of the breast, gives the following practical suggestions which might prevent the development of precancerous lesions

"1 More careful history-taking with an accurate analysis of the history



2 Education of mothers as to the necessity of nursing their babies

3 If for any real reason the mothers are not able to nurse their babies, insistence on the use of a breast pump (preferably an electric one)

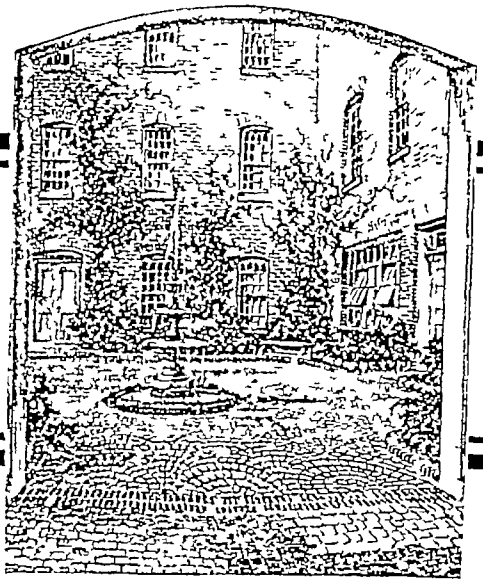
4 More careful attention to the care of the nipples

5 Correction of pelvic disorders especially when there is any pain in either breast during the menstrual periods

6 More consideration to the proper support of the breast at all times"

Detail of pocket in bust compartment of opposite photograph (as seen from inside)

Support for heavy, pendulous and extremely pendulous breast



The bust compartment of the Camp Breast Support (illustrated) is designed with an extra, inside, well-fashioned piece of material forming, with the outer fabric, a pocket into which the breast fits Reinforcing pieces of fabric come from under the arm, circle around under the breast, serving as a shelf for support, and are attached to the opposite shoulder strap, these shoulder straps are provided with an elastic insert

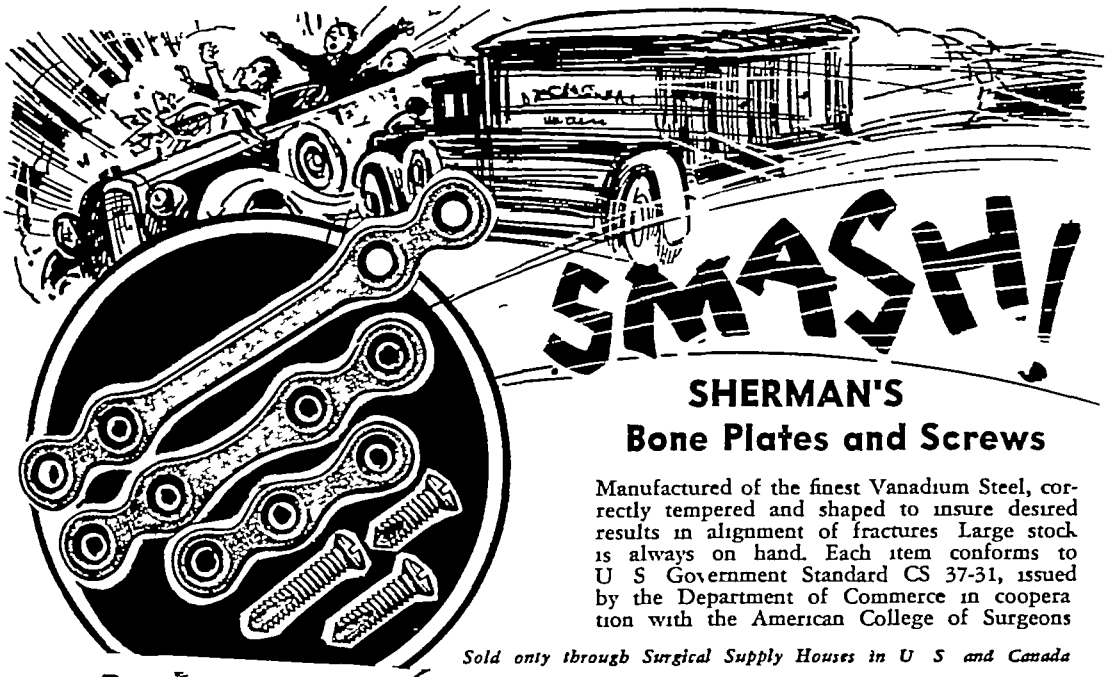
CAUSE and EFFECT

Planck said. "It is an indisputable postulate of all scientific research . . . that natural phenomena invariably occur according to the rigid sequence of cause and effect."

It has been rightfully stated that there are two kinds of experiments from which two kinds of facts, generally speaking, are obtained, leading to qualitative and quantitative facts

The careful and repeated observance of what happens in nature and then verifying the observations, lead to qualitative facts

The proper experiments in chemistry and the physical science of the product examined lead to quantitative facts



Our quality pharmaceutical products are guaranteed as to purity and identity in assay of raw materials; accuracy, cleanliness and perfection of production and uniformity and correct dosage of the finished products—all supported by laboratory control records for the protection of the medical profession and their patients.

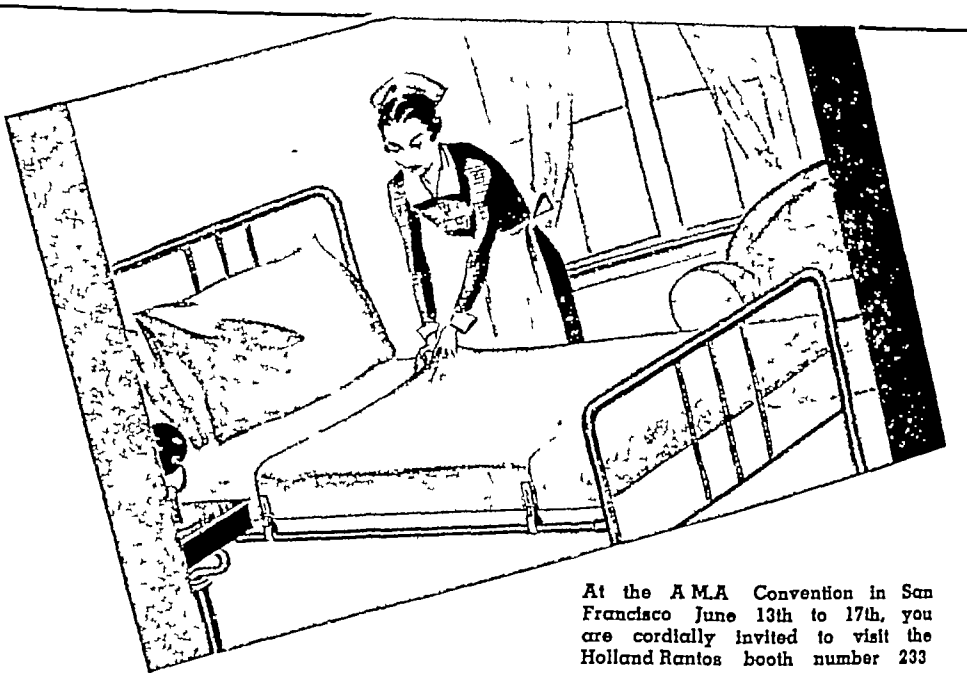
BORDEN'S BRIEF BIOGRAPHIES

★ GRANDMOTHER ELSIE ★



Mother of ten—all champion milk producers for Borden Maxim handed down to her descendants: If a thing's worth doing, it's worth doing *well.*

Our farmers say "You have to be *good* to sell milk to Borden's" And it's true! Borden's careful inspections and Borden's daily milk-checks may seem like foolishness to some people—but we know they're necessary Particularly when so much of this milk goes to babies—in the form of Borden's Irradiated Evaporated Milk

Borden's Evaporated Milk was accepted in 1930 by the American Medical Association Council on Foods

Recommending Borden's by name is a wise protection when you prescribe an evaporated milk formula for infant feeding

At the A.M.A. Convention in San Francisco June 13th to 17th, you are cordially invited to visit the Holland Rantos booth number 233

RANTOSILK *and* HOLLANDEX
For Home and Hospital Use

● For bed sheets, pillow cases, surgeons' aprons, and surgical garments used in hospitals, take advantage of Rantosilk or Hollandex—the last word in processed surgical fabrics. They are fine silk and lawn calendered with crepe rubber—are light in weight and will outwear much heavier material.

Their ability to withstand creasing, rolling and folding without the slightest harm to the surface commends it for hospital use. They may be washed, boiled, autoclaved, stitched. Will not crack, peel, fade or stick. Resistant to acids, alkalies and heat. The positive impregnation with rubber of each fibre accounts for the superiority of Rantosilk and Hollandex. *Write for literature*

THE NATURAL MINERAL WATERS OF SARATOGA SPA
ARE OWNED AND BOTTLED BY THE STATE OF NEW YORK

In Conditions of Dehydration

the patient will find the *natural* carbonation of the Spa mineral waters a stimulus to ingestion These saline-alkaline waters, as will be seen from the accompanying analyses, are richly mineralized—more so, even, than many artificially mineralized waters The sodium content in the Spa waters is a valuable element in dehydration, as it aids in holding water in the body They replace the chlorides lost in vomiting or diarrhea Your patient will find Geyser Water especially palatable

Professional literature on the Waters is available to all interested physicians To those who wish to experiment clinically, a physician's sample carton of 4 bottles will be sent on request. Please write on your professional letterhead Address W S McClellan, M.D., Medical Director, Saratoga Spa, 155 Saratoga Springs, N Y

UP GOES THE *Hemoglobin and Red Cell Count* when you prescribe McKESSON'S COPPER-IRON COMPOUND

The Chart below tells the story In September, the patient's hemoglobin was 57% red cell count 3,890,000 After the attending physician prescribed six bottles of McKESSON S COPPER IRON COMPOUND, hemoglobin showed an increase to 74%, and the red cell count to 4,400,000 early in December

	H B	RED CELLS	
9/8	57%	3,890,000	
9/25	66%	3,910,000	2 bottles
11/10	66%	4,080,000	2 bottles
12/3	74%	4,400,000	2 bottles

Many interesting case histories, from physicians throughout the country, show rapid and sustained improvement in nutritional and secondary anemias when McKesson's Copper-Iron Compound is prescribed

Naturally, you will have complete confidence only when you have watched improvement, in one of your own anemia cases So, we will send you a professional sample to prescribe It is pleasant for the patient to take for McKesson's Copper-Iron Compound is an effectively balanced protein combination of organic salts of copper and iron It is assimilable, non toxic and non-astringent It does not affect elimination, the teeth or digestion And it's gratifying to see the hemoglobin and red cell count go up when you prescribe McKesson's Copper-Iron Compound! Use the Coupon below for a professional sample and an informative booklet you will be glad to add to your library

Looking For Real X-Ray Value?

IF you are looking for a real x-ray value—one that you can depend upon to be a good investment, produce excellent results, and meet your needs—you will find it in the G-E Model R-36 Unit.

It Packs Real Power—chest radiographs with 1/10th and 1/20th second exposures at six foot distance. The two focal spots in the radiographic tube provide fine detail over a wide diagnostic range. Head to-Toe Fluoroscopy—at any angle, with a separate tube and high-voltage circuit operated direct from the convement, accurate, easy-to-operate control stand

A Fine Investment—designed and built to give satisfactory, dependable service, the R-36 is a major calibre x ray unit—and it's priced right. Compact and self-contained, it needs but little floor space. As a sound, economical investment, you owe it to yourself to fully investigate its place in your practice

Why not do as hundreds of your progressive colleagues did? See this modern diagnostic unit in actual use. Or if you wish, first get your copy of the interesting, easy to read R-36 catalog We will send it without cost or obligation—just sign and mail the handy coupon, today

This we *know* about Acidophilus Milk

● These two basic factors, more than any others, determine the value of any acidophilus milk

1 The quality of the original milk from which it is made

2 The number of viable acidophilus bacilli in the milk

So, reasoning from this which we know, it would seem advisable always to prescribe Walker-Gordon Acidophilus Milk by name That's because Walker-Gordon Acidophilus is made from the world's finest milk—Walker-Gordon Certified and it consistently contains an unusually high number of pure culture viable lacto-bacillus acidophilus organisms—*double* the number contained a few years ago

Furthermore, Walker-Gordon Acidophilus Milk is delivered to your patients fresh daily

● *For a sample bottle and further information regarding Walker-Gordon Acidophilus Milk, write to Walker-Gordon Laboratory, Plainsboro, New Jersey*

WALKER-GORDON

How the Deaf Hear with CORONATION ACOUSTICON

This diagram of the ear will help you explain both bone conduction and air conduction to your patients. Interestingly colored it will look very attractive on the wall of your office We will be glad to send one of these diagrams to you free upon request so that you may easily explain how your patients can hear with a Coronation Acousticon

• **A CROWNING ACHIEVEMENT IN THE HEARING AID FIELD,** the Coronation Acousticon is notable for its tone-controlling variants and the clarity with which it reproduces both brilliant and mellow sounds Its unusual flexibility makes it more than ever adaptable to individual hearing requirements

• **SEND YOUR PATIENTS TO YOUR LOCAL ACOUSTICON INSTITUTE** for custom fittings on the Aurogange and Acoustiscope, the instruments by which Acousticons are fitted with scientific accuracy If you prefer, fittings will be made at your office or in your patients' homes There is no charge or obligation for this service.

• **HAVE YOU ANY PATIENTS WHO SHOULD BE WEARING ACOUSTICONS,** but are reluctant to do so because of psychological factors? We believe we can help you break down their resistance and make them understand that Coronation Acousticons are no more conspicuous or inconvenient than eye glasses. Won't you give us their names? We want to send them literature especially prepared to assist you in breaking down their psychological objections and make them cooperate with you and follow your recommendations. Send us the names and addresses of these "hard to convince" patients Of course, your name will not be mentioned in our correspondence with them—unless you say so

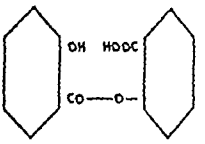
WHY DRUGGISTS MUST BE HANDWRITING EXPERTS

"Ever since physicians first began writing, prescriptions have been as unintelligible as hieroglyphics to the average layman Many a patient has marvelled at the skill of the pharmacist who translates it into terms of drugs, herbs and medicinal compounds

Often it is necessary to 'phone the doctor and verify what he has written In a few foreign countries the physician is held strictly responsible for any error made In the United States the pharmacist is responsible" (Condensed from THE AMERICAN WEEKLY)



And Doctor—LIGGETT pharmacists are happy to assume such an important responsibility Millions of prescriptions are compounded yearly by LIGGETT pharmacists Our perfect record for filling prescriptions accurately is unsurpassed in pharmaceutical history

THYROID DISEASE

Important Problems in Diagnosis and Management

GEORGE E BEILBY, M D and JOHN C MCCLINTOCK, M D, *Albany*
From the Department of Surgery of the Albany Hospital and the Albany Medical College

Curative treatment of any disease must of necessity rest upon an accurate etiological diagnosis of the entity present To those of us who reside in the State of New York, therefore, it becomes important to keep constantly in mind the fact that goiter is endemic within our state Many of the varied manifestations of thyroid disease will be more easily recognized if we have foremost in our thoughts a reminder that thyroid disturbance may be a part of, or the basis for, our difficult diagnostic problems From an experience of over three thousand thyroidectomies the authors wish to exemplify some of the more troublesome diagnostic problems and to direct attention to misleading influences that affect the diagnosis

Before it is possible to approach the recognition of baffling problems, it is necessary to have in mind those symptoms and findings that are present in the patient with hyperthyroidism of typical form We are omitting from this discussion the question of hypothyroidism because of its relative infrequency in this state

The classical triad of exophthalmos, tremor, and tachycardia leave no doubt in the mind of the examiner as to the correct diagnosis The number of patients that present an obvious diagnosis are, however, in the minority when compared to the larger group with only one or two of the classical symptoms and who more prominently exhibit many of the lesser manifestations of hyperthyroidism Of these other symptoms, fatigability is one of the most common There is no diminution of desire for work but there is a definite physical limitation on the amount that can be done without fatigue Nervousness is an almost universal complaint, but it is a blanket and unscientific term used by the patient to cover the many nervous system changes of the disease

Unless specifically asked, the patient will frequently include emotional instability and increased irritability under this complaint Tremor is fairly constant and is of important diagnostic aid It may be the objective, fine tremor of the outstretched fingers, or the patient may describe a subjective feeling of trembling within the body

Because of the increased metabolism induced by the disease one of two things must happen, there must be a weight loss, a frequent complaint, or the food intake must increase, usually it is a combination of the two Hyperhidrosis and a feeling of increased warmth with heat intolerance are not uncommon Shortness of breath is so common that Bartlett[1] has described a simple test that is of aid in determining the optimum time of opera-

Read at the Annual Meeting of the Medical Society of the State of New York Rochester, May 25, 1937

as described is easy to identify when contrasted with the difficulties of arriving at a diagnosis when only one group of symptoms dominate the picture Thus, in the middle-aged patient very often the only symptoms are related to the cardiovascular system and the treatment given is not often limited to the heart. A tachycardia that fails to respond to the ordinary medical management, must be considered as thyroid in origin unless there exists another proven cause Auricular fibrillation most emphatically demands consideration of a thyroid

Fig 3 Position of hands to palpate thyroid gland. Fingers behind sternocleidomastoid muscle, thumb in front

Sometimes these queer manifestations of hyperthyroidism relate to the gastrointestinal tract and many unusual symptoms result Some have been mistaken for such disorders as colitis, diabetes, peptic ulcer, and gall-bladder disease [2 3] Appendectomy has been done for symptoms that simulated acute appendicitis [4] Although all of these mistaken diagnoses have been recorded in the literature it seems incredible that the true cause could have been so completely overlooked Nevertheless, they serve to illustrate the fact that thyroid disease must be ever present in the minds of those who live in areas where goiter is endemic.

The symptoms that suggest the need granted we are alert to the

possible presence of hyperthyroidism, what findings, then, will be helpful to us in arriving at a positive diagnosis? The most important of all is the presence of a goiter In Grave's syndrome, the gland may be small and hard to feel, while in the adenomatous type the nodules may be substernal or retrotracheal and difficult to find These variations in the position and consistency of the gland make it essential that we have some adequate method of palpating the thyroid gland

There are undoubtedly many excellent modifications but the following method has proven to be the most satisfactory for the authors (Fig 1-3)

The examiner sits in front of his patient who is seated erect, head straight in the anatomical position, the shoulders relaxed To palpate the left lobe, the examiner's left hand is placed over the right shoulder of the patient, around the base of the neck so that the thumb can make pressure against the larynx and trachea This pressure, when applied, rotates the trachea and larynx and pushes the visceral compartment of the neck laterally so the examiner's right hand can easily feel the left thyroid lobe The fingers of the examining right hand are so placed that they catch the lobe behind the sternocleidomastoid muscle and press it forward The thumb of examining hand is anterior to the muscle and between thumb and fingers, the size, shape, and consistency of the lobe can easily be determined The hands are then reversed in their relative positions to study the right thyroid lobe. It is sometimes helpful to have the patient cough or swallow to bring up any substernal enlargement to where it may be felt, at least in part.

The characteristic firm, meaty, feel of the exophthalmic goiter or the nodules of the adenomatous goiter are ample confirmation of symptoms for the diagnosis It is when suggestive symptoms exist without palpable enlargement of the gland, or when the thyroid imparts a soft, pulpy feeling to the palpating fingers, that other findings become helpful in determining the true diagnosis In general, however, it may be said that if careful examination of the neck fails to reveal thyroid enlargement, the diagnosis of disease of this gland becomes hazardous

One of the most helpful of the findings in making a diagnosis is the pulse rate In doubtful cases this must be studied at bed rest over a period of several days A persistently high pulse rate, one that is high during sleep, strongly favors hyperthyroidism, while a labile pulse rate, one that drops to normal after a few hours bed rest, and that fluctuates with slight exertion, is equally as suggestive that thyroid disease does not exist The blood pressure in typical hyperthyroidism shows a high pulse pressure with a lowered diastolic reading

Hurxthal[5] has cautioned against making a diagnosis of hyperthyroidism in the presence of cold, moist hands and feet A patient with true hyperthyroidism will present warm, moist hands and feet and if the opposite is found great caution must be exercised in reaching the diagnosis

The eye signs of thyroid disease are obvious and strengthen the diagnosis, but their absence does not preclude the possible presence of hyperthyroidism The same statement may be made in regard to a bruit over the gland or a thrill over the superior thyroid arteries

In very rare cases, where the diagnosis is uncertain, the use of a small dose of iodine, either as compound solution of iodine (Lugol's solution) or as sodium iodide may be justified It may be justified only if its use is not continued beyond the point of diagnosis, or if the surgeon is prepared to operate when the maximum benefit of the drug is obtained

Thus far we have been considering the problems of hyperthyroidism, however, there remain that large and important group of nodular goiters, usually passed over by the physician with, "Yes, you have a goiter, but don't do anything about it until it troubles you" The opinions of those men best qualified to discuss this subject are agreed that all nodules of the thyroid gland should be removed The reasons for this are two in number

1 From ninety to as high as ninety-eight percent of all cases of thyroid malignancy seen, give a history of pre-existing adenomatous goiter It is thus within our ability to reduce the incidence of thyroid cancer to an absolute minimum by advising removal of the precancerous lesion

2 Most of the nodular goiters eventually give rise to symptoms of hyperthyroidism and it is in association with this type of gland that the atypical manifestations of the

disease are commonly found—the misleading cardiovascular, gastrointestinal, and nervous system symptoms that have so frequently been the cause of long delay in proper curative treatment

There is no iodine solution or salve, no electrical or injection treatment, nor any other authoritatively established method of dealing with these adenomata except surgery Once the nodule is out of the neck it can do no further harm, but unfortunately the patient too often receives the type of advice already described, or is the victim of an ignorant attempt to "absorb the growth," or fails to seek medical aid entirely With those who fail to obtain help until late in the course of their disease we can do but little, but with those patients who ask advice early, it is possible for us as a profession to eliminate the mortality from thyroid disease Less than one-third of all deaths due to thyroid disease are postoperative, and these are largely the patients that have been long neglected or overiodinized

We have been considering those observations that can be made in the office for the most part, and we feel that the history and physical examination are of paramount importance in making a diagnosis of thyroid disease There is one laboratory test that is said to be of aid in solving a given problem, but the authors feel that the habit of relying upon the determination of the basal metabolic rate as the chief criterion for diagnosis has done more harm than good to physician and patient alike Du Bois[6] has said, "No clinician should send a patient for a basal metabolism test, or a roentgen ray examination, or any other similar diagnostic procedure until he has taken a careful history, made a thorough physical examination, and recorded his clinical diagnosis in writing" To this attitude these authors wholeheartedly subscribe and because of this feeling they have devoted much of this presentation to the important clinical steps in making the diagnosis

Determination of the basal metabolic rate requires more detailed consideration because of the false sense of security it imparts to both profession and laity which in turn, has lead to a growing tide of criticism of the test as it is usually done and interpreted One writer[7] has indicated that the clinician must be sufficiently experienced to estimate within ten points of the rate as actually determined before he is qualified to correlate this result with the clinical findings Experience with thyroid problems does enable the physician to accurately state what the metabolic rate will be, and his clinical judgment is very often more reliable than a single determination of the metabolic rate We might well inquire into the factors that contribute to the difficulties with this test

The sources of error in determining the metabolic rate are four in number—the machine, the technician, the doctor, and the patient We will presume that the apparatus is mechanically in good condition The technician must have long experience with the test and must possess the rare type of personality that enables her to gain the confidence of the most irritable and excitable patient An innocent remark, an indifferent attitude, any one of many apparently inconsequential things may be sufficient to disturb the patient and cause an incorrect result

The doctor may tell his patient that the test will determine whether or not an operation is necessary which is not only incorrect but may also cause his patient to worry and wonder about the outcome and again the reading will be inaccurate The doctor, in addition to being judicious in his promises for the test, must likewise be cautious in his interpretation of the results Unless the rate confirms the clinical findings in the presence of a goiter, repeated observations are imperative for accuracy

The patient is the most difficult of all the sources of error to control Mental activity, emotional disturbances, physical discomfort—these and many other trivial factors combine to result in a rate that does not represent the patient's metabolic level Familiarity with the procedure is of value in overcoming these difficulties, and repeated observations are essential for determining the presence of a truly elevated metabolic rate It has been our experience to find that patients who show obvious clinical hyperthyroidism will have a marked fall in the rate as determined on successive days that is entirely out of proportion to the rest in bed and iodine received Patients with hyperthyroidism,

however, will not show a drop to normal values in two or three successive readings as will those in whom the disease is not present, and in whom there is no other cause for an elevated rate

The authors have recently studied a large group of cases in which the symptoms suggested a possible diagnosis of thyroid disease or in which the diagnosis was actually made and in a few cases, operation advised In this group are patients that have been shown to be suffering from essential hypertension, organic heart disease, cardiovascular neurosis, menopausal neuroses, psychopathic personalities, and even pregnancy In addition to this group studied in the hospital, we have examined many patients in the office where the absence of thyroid disease could easily be determined These patients have been referred with the diagnosis of hyperthyroidism, usually as based on a single, elevated determination of the metabolic rate. Palpation of the thyroid has revealed a normal gland in all of these patients, and a careful history failed to elicit the story of true hyperthyroidism A few cases are characteristic of the entire group and they serve to illustrate the value of repeated observations of the metabolic rate They emphasize our belief that without palpable evidence of goiter, the diagnosis of hyperthyroidism is a dangerous procedure.

CASE 1 H C, aged twenty, entered the Albany Hospital complaining of nervousness, vertigo, fatigability, shortness of breath, and tachycardia of two months duration. Examination revealed cold, moist hands and feet, and a normal thyroid gland Repeated observations of the metabolic rate were all within normal limits The pulse curve and its reaction to sleep, rest, and activity is portrayed in Fig 4 which illustrates a typical labile pulse rate The patient was found to be an excessive user of tobacco and coffee and the elimination of these, together with a medical regime of normal living have been responsible for a well patient.

CASE 2. G S, aged twenty-three, entered the Albany Hospital because of nervousness, tremor, tachycardia, weakness, and fatigability of three years duration He had been taking Lugol's solution for three months without improvement in his symptoms A metabolic rate in another city was

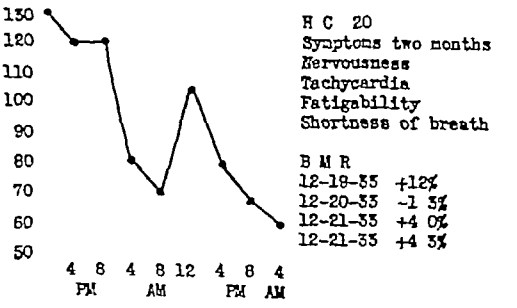

Fig 4 Marked variations of pulse curve due to rest and exercise.

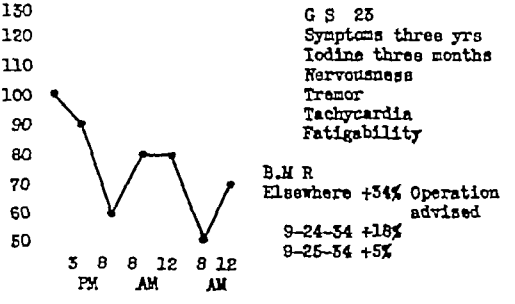

Fig 5 Rapid drop in metabolic rate when determinations are made on successive days

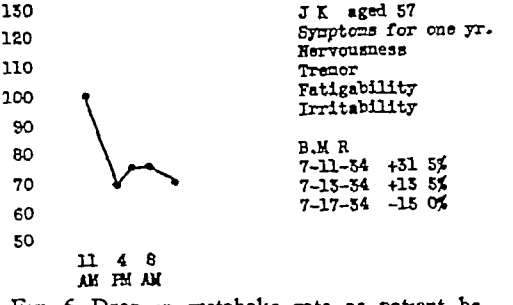

Fig 6 Drop in metabolic rate as patient becomes familiar with test.

reported as plus thirty-four percent and on the basis of this one observation, an operation had been advised The metabolic rate was determined as plus eighteen per cent and the following day as plus five The thyroid gland was normal The pulse rate (Fig 5) again varied with the activity of the patient, although not so widely as in the first case With this patient also, medical management, chiefly concerned with proper living, has relieved the symptoms

CASE 3 J K., aged fifty-seven, entered the Albany Hospital for relief from nervousness, tremor, headaches, weakness, excessive fatigability, emotional instability, and irritability of one year's duration Examination revealed arteriosclerosis, moist,

cold hands and feet, and a normal thyroid gland The first basal metabolic rate was plus 31 5 per cent, two days later, plus 13 5 per cent, and after three more days, without any medication, the metabolic rate was minus fifteen per cent

CASE 4 M C, aged forty-one, was examined in the office because a diagnosis of hyperthyroidism had been made and the patient advised to have an operation She complained of nervousness, slight tachycardia, and amenorrhea of three months duration The basal metabolic rate, on which the diagnosis had originally been based, was plus twenty-one percent Gynecological consultation confirmed the impression of pregnancy The thyroid gland was normal to palpation

The results of determining the metabolic rate in patients with nodular goiters have been equally unfortunate in their interpretation A patient with a visible nodule is told that operation is not necessary because the metabolic rate is found to be normal or below Thyroid extract has even been prescribed because the rate was discovered to be below normal levels Large, colloid goiters, and adenomatous goiters very commonly are associated with a subnormal metabolic rate but the treatment is nonetheless surgical After removal of these pathological lesions, the metabolic rate will return to normal and the mild symptoms of hypothyroidism disappear

Hyperthyroidism may exist with a metabolic rate that is within the limits considered to be normal The literature on this peculiarity is rapidly becoming more voluminous, and mention is frequently made of this phenomena in the reports of large numbers of toxic patients The only explanation offered for this curious association of a low metabolic rate with hyperthyroidism is the fact that we do not know what the normal rate for the patient in question really is Plus ten per cent may actually represent an elevation of twenty points The most striking example of this group that the authors have studied was a patient[8] in whom the metabolic rate was minus twelve to minus thirteen per cent on three successive determinations, and yet, histological evidence of hyperplasia was obtained by a subtotal thyroidectomy that relieved the patient of her symptoms

It becomes obvious that the metabolic rate is often misleading and may result in an unfortunate experience for both patient and physician The financial and even physical loss resultant from placing reliance upon the test for diagnosis is incalculable It becomes a grave challenge to the profession to prevent these losses, a challenge that is easy to accept if we appreciate with Du Bois[9] that the basal metabolism is not always a reliable guide to the diagnosis

We are now at a point in our consideration of thyroid disease where some form of treatment is to be prescribed The tremendous reduction in both morbidity and mortality that has come from the work of Plummer with iodine, can only be fully appreciated by those who dealt with the surgical problems of thyroid disease before and after the widespread use of this drug Those of us whose experience does not include the preiodine period of thyroid surgery see that the most valuable contribution made to thyroid surgery in many decades is regarded as a panacea without any thought of the economic loss or even fatal outcome that may follow the injudicious use of this remedy Knowledge that iodine will produce a remission in the course of hyperthyroidism, has led the public and the profession alike into extraordinary misapplication of this information

The maximum benefit from the use of compound solution of iodine is obtained in from ten to fourteen days, a fact so well-established that it need only be mentioned It does remain to show that long-continued use of the drug in hyperthyroidism is responsible for increased morbidity and elevated mortality in goiter surgery Increase in morbidity is difficult to express adequately, but experience teaches us clearly that those patients who have received iodine before preparation for surgery are more dangerous operative risks There are so many variables in the stay of any one patient in hospital that comparisons suffer accordingly, nevertheless, in comparing two groups some enlightening facts are found Those patients that received iodine before admission had a slightly longer hospital stay than the group that first received iodine as a preparation for surgery The average pulse drop of the iodinized group was ten points less than the control group Weight

change in those already taking iodine averaged a loss of three pounds preoperatively while the other group averaged a weight gain of one pound There were more two-stage operations necessary to insure safety in the group receiving iodine before hospitalization

An analysis of twenty-five postoperative deaths that have occurred in the last ten years has revealed that fifty per cent of these patients received iodine medication before coming to surgical treatment The average duration of the goiter for the entire group was twenty years Six deaths that occurred preoperatively in the same period when studied showed that five of the six had been treated for heart disease for periods as long as two years and the sixth had received iodine therapy for the four months of her hyperthyroidism Early diagnosis and prompt surgical treatment would have restored these patients to a useful life Such are the problems that comprise the one per cent mortality that must be maintained by any surgeon operating upon large numbers of goiter patients This low rate is in contrast with the general mortality rate for thyroid surgery of ten to twelve per cent as indicated by Hicken [10]

The warning signals against abuse of iodine were early raised by Haggard and Floyd[11] in 1928, when they asserted that "the diagnosis of hyperthyroidism is the indication for operation" Hume[12] showed in 1931 that the misinterpretation of the marked improvement with Lugol's solution led to a false sense of security and a feeling of cure with consequent delay in the inevitable surgery beyond the optimum time. Means[13] has likened the temporary improvement obtained by iodine, to applying the brakes on a fast moving car while the accelerator is still open The disease is only slowed in its progression and not cured More recently Wetherell and Groat[14] have drawn our attention to the fact that not only is the economic loss to the patient greater when there is a medical attempt to cure hyperthyroidism by iodine, but more important, the morbidity is markedly increased These authors show that most of the one percent mortality of the experienced surgeon is due to large substernal, and long neglected toxic goiters, not a few of which have been made iodine fast by too long medication With regard to prescribing iodine Wetherell and Groat say "that the importunings of the patient should influence the judgment of the physician is inexcusable That 'another will if I do not' is even more questionable logic" With more widespread recognition of the truth of these warnings will come a marked drop in the morbidity of, and mortality from thyroid disease

Summary

1 Accurate diagnosis of thyroid gland disease must be based upon a carefully taken history and an adequate physical examination

2 The metabolic rate as ordinarily determined will neither establish a diagnosis nor indicate the necessary treatment

3 The use of iodine should be restricted to the preoperative preparation of the patient Rarely will it be necessary to prescribe this drug as an aid in making a diagnosis

4 Observation of these three simple fundamentals in the diagnosis and management of thyroid problems, will inevitably lead to a marked reduction in the mortality from thyroid disease

Discussion

Dr. Raymond P Sullivan, *New York City*—The features of diagnosis and management of thyroid disease brought to our attention by Dr Beilby are truly significant and worthy of emphasis This is so, because an experience of three thousand cases offers

real opportunity for the analysis of details sufficient for the deductions made and justification for enumerating them

The problems presented plainly indicate that they involve directly or indirectly every phase of medical practice. Therefore, the subject is a varied and complex one, which no one individual has, as yet, fully grasped, for no one individual seems to know enough about it, to do that But, as time marches on, and contributions, like the one here today, are made, a better recognition and evaluation of the atypical findings and symptoms will furnish evidence for earlier diagnosis and appropriate treatment before permanent damage is done to important vital organs like the heart, liver, nervous system, etc.

A practical application to be derived from such lessons will be enhanced by an appreciation of the structural changes in the thyroid gland incident to the various types of goiter The value of such understanding is contingent on keeping in mind the histology of the normal thyroid Briefly, we know the thyroid is a highly vascular organ, invested by a thin capsule of connective tissue, which projects into its substance, and divides it into masses of irregular form and size. The vesicles are lined with cuboidal or low columnar epithelium supported by a sustentacular tissue common to gland structure. Groups of cells in the intervesicular spaces have been considered as reserve parenchymal cells, from which new acini are formed Whether or not this concept has been definitely traced, is open to question However, such a conception is fundamental in the study of thyroid pathology as related to functional activity

There are three types of structural change in the pathological thyroid, most frequently encountered

1 Fluctuations in the amount of colloid stored in the vesicles—known as "colloid goiter"
2. Hypertrophy or hyperplasia of vesicular epithelium—"exophthalmic goiter"
3 Development of new acini—"adenoma."

These structural changes give rise to a variety of clinical conditions For a long time confusion existed, because of a lack of a simple classification of the pathological entities in the thyroid Personally, after more than twenty-five years of study and management of thyroid cases, the simple and lucid classification suggested by the late Henry S Plummer, has been followed with satisfaction and comfort, especially after having learned—by personal observation—its value and importance on patients managed by Dr Plummer himself His classification is

1 Simple goiter (colloid or adolescent)
2 Exophthalmic goiter (Grave's disease)
3 Adenoma (toxic or nontoxic)
4 Carcinoma, tuberculosis, thyroiditis, etc.

This grouping was never intended by Plummer to be considered as a scientific classification of goiters, for he believed that we did not have enough knowledge to warrant making a scientific classification However, he announced more than twenty years ago, "that a definite and constant relationship of the clinical symptoms and pathological conditions existed in cases of hyperthyroidism" It is noteworthy that since this statement, there has developed a preponderance of opinion in agreement with Plummer, which is indicated by Dr Beilby

True hyperthyroidism is met principally in two types of structural change within the thyroid They are *exophthalmic goiter* and *hyperfunctioning adenomatous goiter* It is quite possible that mild hyperthyroidism may be present in other conditions like essential hypertension or psychoneurotic conditions However, it is worthy of note that one must avoid the diagnosis of hyperthyroidism in cases of gastrointestinal conditions like enteroptosis with stasis and its associated toxic state producing a syndrome of fatigue, tachycardia, and possibly mental irritability and mild tremors associated with a thyroid which may be palpable with difficulty, and diagnosed as *hyperthyroidism* Such an individual may acquire a fixed idea and desire thyroid surgery The lack of definite findings consonant with true hyperthyroidisms will guide the careful diagnostician to the proper opinion

One might designate such cases as "relative hyperthyroidism" for they will fail to reveal the usual reactions that *must* accompany an elevation of the rate of energy transformation in the body, found in true hyperthyroidism, and on more than one test.

Hyperthyroidism associated with adenomatous goiter is a progressive condition *without remission* The toxic symptoms are always preceded by the presence of goiter The clinical manifestations of toxicity may not be appreciated or develop for years, and hence fail to be recognized until treatment for cardiovascular disturbances or muscle weakness reveals the necessity of determining a persistent and progressive etiology Such etiologic factor can be a result of a hyperfunctioning adenoma in the thyroid, as emphasized by Dr Beilby It is this type of goiter case that the surgeons so often receive at a late stage, and hence must accept the responsibilities of the increased risk. These cases present the problems calling for extraordinary caution and ex-

pert management. Another serious problem met in the surgical treatment of adenomatous goiter is the toxic case produced by the unintelligent use of iodine, in a previously nontoxic adenoma. The most frequent complications encountered in these neglected adenomatous goiters are heart failure and embolism. Therefore, the warnings of Dr Beilby are not only pertinent but eminently justified.

In exophthalmic goiter the essential characteristic of all cases is *remission*. The goiter develops after the symptoms are present. They are either remittent or chronic. The remissions are often mistaken for cures only to have the entire picture suddenly renewed by fright, sickness or overwork. In the chronic form the disease progresses slowly and is usually mild in its course. In either type the longer the progress of the disease, the greater the risk, because of the consequential damage to vital organs.

As a result of our own experience we feel convinced that a simple formula in diagnosis which has proved helpful and satisfactory is as follows: *Goiter plus symptoms equals adenoma. Symptoms plus goiter equals exophthalmic goiter.* Of course, by symptoms we mean the signs of tachycardia, tremors, mental excitability or irritability, weight loss, etc.

Intelligent management and treatment of hyperthyroidism is *best* when there is an appreciation of the histologic changes which have occurred and are occurring in the thyroid, also the consideration of each case as an entity. Many procedures have been suggested and used. The claims of success are at times enthusiastic and at times pessimistic. I refer, of course, to the nonsurgical procedures. However, it is my conviction that surgery offers the principal mode of attack, and by it the most efficient and beneficial results are obtained. I do not advocate surgery as the primary mode of attack, because proper preliminary measures are not only essential, but definitely the factors which influence both the morbidity and the immediate and late mortality.

A standard preoperative preparation of patients with hyperthyroidism cannot be rigidly outlined suitable for all cases. The preparation must be adapted to the individual patient, because no two cases present the same degree of toxicity. There are, however, essential factors of preparation to be employed in all cases of exophthalmic goiter. They are (1) the use of iodine immediately preoperative for six to ten or more days, (2) physical and mental rest, and (3) high caloric diet. In cases of hyperthyroidism associated with adenomatous goiter the principles are similar, except the use of iodine. We believe that iodine intensifies the symptoms in toxic adenoma and may convert a nontoxic adenoma into a toxic state. If one can be convinced that a mixed type of gland exists, then iodine may be used. Iodine in nodular goiters may be beneficial, but the nodules will most frequently be found colloid rests and not true adenomata.

An important preoperative factor deserving of emphasis concerns weight loss. Rapid or persistent loss of weight associated with hyperirritability and easy fatigue are danger signals of an impending crisis, and definitely contraindicates operation. Such cases should receive glucose in generous amounts both pre- and postoperatively, for it must be remembered that liver damage in severe thyrotoxic states depletes the glycogen.

The length of time for postponement of surgery will of course vary in direct proportion to the duration and degree of intoxication. Here again I wish to emphasize points brought out by Dr Beilby concerning the use or misuse of iodine in goiter patients. Undoubtedly, the dosage and length of time for its proper use will sooner or later be stabilized, but until that time, the profession should heed the warning, and not overlook the danger that can exist, if the principles underlying its use, are not clearly understood. There is much more in the use of iodine in hyperthyroidism than just the idea of a method of treatment. Back of it, is the unalterative necessity to make a definite histologic diagnosis, and advise surgery at a proper time under experienced hands.

Operation in hyperthyroidism will fail to cure when an insufficient amount of gland is removed, or when there is a residual cardiovascular disease or true neurosis. Also, unsatisfactory results are manifested by recurrent hyperthyroidism. Can any definite rule be formulated to avoid such complications? It cannot. To practice a routine removal of a fixed amount will result in many failures. Since the reintroduction of Lugol's solution in exophthalmic goiter, the mortality and complications encountered, during the era of multiple stage operations are greatly reduced, and the ultimate results better. In exophthalmic goiter, prepared by proper recognition of factors of safety, the amount of gland to be excised will depend

on the amount of involution which has taken place Where the involution has been extensive, the amount of gland to be left will be greater than where the involution is limited, or not easily recognizable In single adenoma, enucleation with removal of a wedged-shaped piece of the same lobe after division of the isthmus suffices There should always be careful exploration of the opposite lobe for adenomata, and removed if found In the presence of multiple adenomata, careful removal of all tumors and division of isthmus is the procedure of choice This is warranted as a prevention against the development of further toxic symptoms, and the avoidance of a possible carcinoma change Carcinoma constitutes eighty to eighty-five per cent of the malignant tumors of the thyroid and originates in the majority of cases in a pre-existing adenoma

The surgeon's responsibility does not end with a successful operation Either he should personally direct the reconstruction of the patient, or he should see to it, that the family physician recognizes the importance of proper aftercare, if the patient is to receive the fullest benefit from the surgical treatment True, the operation has removed the mechanical obstruction, or has arrested the hyperfunctioning thyroid, but the overtaxed organism cannot respond at once Nutritional disturbances, resultant from increased metabolism, deserve attention, and proper rebuilding should take into consideration all factors, such as damaged muscle fiber, whether located in the heart, skeletal system or gastrointestinal tract

It should recognize the injury to the nervous system, prone to respond to proper rest, food, and exercise The other tissue demanding consideration is the blood which needs, as a rule, only the element of proper food

DR ARTHUR S McQUILLAN, *New York City*—In regard to symptoms, it has been my experience that fatigability (the lack of endurance) is most common in thyroid disease. It is often lost sight of by both patient and doctor due to the predominating symptoms of push and drive exhibited by these patients In the slow development of hyperthyroidism, there is often recognized the early phase of hypothyroidism in which this symptom of fatigue predominates Under the term "fatigue disease," thyroid disturbances have been described by other observers in this field. If thyroid disease could be recognized and treated in this early phase, the later toxic phase might be avoided

In many instances, subjectively the hyperthyroid complains less than the hypo She will often say, "There is nothing wrong with me I feel all right" She cannot understand why operation is necessary, when it is quite evident to the doctor that she has many of the severe signs of Graves' disease.

Such subjective symptoms as nervousness complained of by the patient, and not merely recognized by others—inward tremor and shortness of breath (the inability to get a deep or satisfactory breath)—are quite common in mild hypothyroid disturbances as well as in hyperthyroid disturbances

As Dr Beilby has said, weight loss and increased food intake are very definite and important symptoms of true toxic goiter This, supported by an elevated basal metabolic rate, is important evidence in making a diagnosis

He has called attention to the fact that often the patient comes with symptoms referable only to the heart This is true and is most often seen in the cases of nodular goiter In this instance the patient has had the goiter for years and the first complaint is heart trouble This as Dr Beilby points out comes in the elderly patient, not with the diffuse toxic goiter Here the younger patient comes soon after onset of the trouble, because such symptoms as sudden and great loss of weight and severe nervous manifestations drive the patient to seek relief

In diffuse toxic goiter, the vagotonic disturbances manifest themselves symptomically in the way of frequent bowel movements or diarrhea and vague abdominal pains—hence the confusion with colitis—peptic ulcer or gall-bladder disease, as Dr Beilby states

Transitory glycosuria is recognized to occur not infrequently in toxic goiter, and is probably due to a disturbed adrenal function and not a true diabetes However, one must always be on the alert in recognizing a true diabetes complicating a toxic goiter This condition is not infrequent, and when it does occur in association with toxic goiter requiring surgery, it is a most grave condition if not recognized Tinker and others have pointed out this condition and especially the fact that a latent diabetes may come to the surface immediately following thyroid surgery Hence the value of preoperative

and immediate postoperative examination of the urine

Findings to arrive at diagnosis, Presence of Goiter As Dr Beilby says, the goiter may be small and hard to palpate even though other signs are most evident Especially is this so in men with heavy neck muscles At operation the gland is usually larger than one's conception of it gained by clinical examination

I recommend Dr Beilby's method of palpating the gland, but I would add that one obtains more relaxation of the neck muscles by examining the patient in the prone position

In borderline and obscure cases, I believe one is justified in using iodine as a diagnostic test—especially if the patient has had no previous iodine medication, otherwise the result of the test may not be sufficient to give one a clue to diagnosis

In regard to blood pressure, I believe that the pulse pressure is increased not only by a lowered diastolic, but also by a raised systolic pressure We see this during operative procedure and have come to regard a rising systolic pressure as a dangerous signal and a warning to cut short operative procedure by doing a ligation or a single lobectomy

Dr Beilby states that eye symptoms when present are significant, but they do not have to be present and when existing alone can be due to other conditions

Nodular goiter I cannot support Dr Beilby too strongly in his attitude towards nodular goiter Surgery is the only means of treatment and it is well-known that when left alone, malignancy or cardiac damage results

Basal metabolism I agree with Dr Beilby that more and more are we realizing that this test cannot solely be relied upon either in making a diagnosis of thyroid disease or in evaluating a surgical risk. To tell a patient that this is a test to determine the need of an operation is nothing less than stupid As Dr Beilby points out repeated determinations are necessary and even these results should not influence our opinion when unaccompanied with other positive evidence

Treatment I hope Dr Beilby's advise in the use of iodine will be spread far and wide Ten years ago, one never saw a case of hyperthyroidism that had not been treated with large doses of iodine for months or years This resulted in neglected cases, cardiovascular complications, multiple stage surgery, and high mortality and morbidity Iodine has no place in the treatment of hyperthyroidism except in the preparation for surgery

I congratulate Dr Beilby on his splendid paper and I am glad to have the opportunity to emphasize his views in regard to the value of the basal metabolic test and the use of iodine in thyroid disease

---

NO UNIONIZATION OF PROFESSIONAL GROUPS

The council of the Oregon State Medical Society at a meeting in January adopted a statement of policy concerning attempts that have been made to organize established professional groups and groups of persons engaged in services supplementary to professional work into labor unions

Such efforts must be opposed, the statement says, as quoted in the Illinois Medical Journal, in the interest of maintaining the freedom of action and initiative essential to carrying on and improving the standards of professional services The statement points out that the principles and methods which may be legitimately employed by labor organizations are incompatible with the practice of a profession

Labor organizations have for their prime object the improvement of wages, hours and conditions of employment for their members, the medical profession has assumed the obligation of caring for the sick and injured, "without discrimination on account of racial, religious or other conditions of the kind, continuously and unflaggingly in peace, war, flood, fire, pestilence, come what may," the statement continues

"It must not put the compensation or convenience of its members before the public need It would be unthinkable for the medical profession or any other group engaged in the healing arts to refuse to render the services it has undertaken to perform, to go on strike and prevent others from taking up its work"

The Oregon State Federation of Professional Societies has also adopted a resolution to the effect that affiliation of its members with trade unions or similar organizations is incompatible with the obligations of professional men and women and hence detrimental to the public welfare The federation is made up of the state dental association, graduate nurses' association medical society, pharmaceutical association, society of radiographers and veterinarians' association

DUODENAL STASIS

JOHN M BARNES, M D, *Buffalo* and DANIEL E STEDEM, M D, *Kenmore*
From the Department of Radiology, Millard Fillmore Hospital, Buffalo

The condition variously known as duodenal stasis, intermittent partial duodenal obstruction, writhing or surging duodenum has been the subject of rather voluminous and controversial literature We hope neither to completely review this literature nor settle many of the controversial points Rather it is our purpose to report our experiences in dealing with the condition and urge the necessity of its more universal and early recognition

Classically duodenal stasis occurs in the ptotic, hollow-chested, long-waisted asthenic or ulcer type of individuals We may further identify this constitutional type with effort syndrome, hyperthyroidism, sudomotor and vasomotor instability, and those numerous indefinite symptom complices called neuroses

In these patients abdominal symptoms may appear at any time from childhood to adult life and vary in severity from the most vague dyspepsia to severe and prolonged nausea and vomiting Ulcer, gall-bladder disease, and appendicitis may be simulated but throughout the case histories is noted a strong tendency to periodic attacks of nausea or vomiting often associated with migrainous types of headaches The course is often intermittent with long periods of relative well-being The greatest incidence is found in females, though males are by no means immune

In the most severe cases with prolonged bilious vomiting a clinical suspicion of the true condition can be entertained with some degree of accuracy However, in the less clearly defined cases clinical conclusions are highly inaccurate The indefinite symptomatology in this latter group is responsible for their being relieved successively and ineffectually of most of their removable abdominal organs together with their teeth and tonsils The temporary improvement following each abdominal operation is probably attributable to bed rest and is comparable to the relief obtained by the Weir Mitchell type of treatment. However, the end result of the extirpations is usually unsatisfactory unless, of course, frankly pathological organs are removed and in the end stage we have the undesirable superimpositions of adhesions, menopausal symptoms, and poor mastication on the original complaint.

It is only by means of gastrointestinal x-ray examination that the majority of these cases can be diagnosed Characteristically one finds an atonic, ptotic type of stomach with evidence of some drag at the superior duodenal angle and again at the ligament of Treitz. The duodenal loop comprised of descending and ascending portions, together with the lower angle show varying degrees of stasis or puddling, dilation and writhing or surging Here a pitfall in diagnosis is encountered since, in persons of this build and even in those of sthenic habitus, a minor degree of the three cardinal signs—puddling, dilatation, and reverse peristalsis—may be present[1,2] It is, therefore, necessary to have a well-defined mental image of the normal duodenal mechanism occurring in the various types of habitus Having established this norm the frankly pathological cases are easily recognized However, a certain group of borderline deviations are encountered where repeated examinations and careful clinical correlation are necessary before conclusions can be drawn The cardinal findings must be demonstrated repeatedly at different observations during the same examination or even at subsequent examinations Furthermore, it must be recognized that some of the writhing cases are symptomatic or reflex arising as an accompaniment of gall-bladder, appendiceal or colonic pathology This group can only be established by performance of the complete examination

In severe cases of duodenal stasis we may find dilatation and atonicity of the

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

bulb with relaxation of the pylorus Several of the severe types have shown accompanying disturbed motility in the upper loops of jejunum In such instances these loops are distended and inactive, the appearance being that of temporary paresis We have observed complete absence of jejunal motility over a period of ten minutes during which time the stomach and duodenum appeared hyperactive This type of disturbance is suggestive of the neuromuscular incoordination encountered in lead poisoning, tabes, and advanced arteriosclerosis

A good number of our cases have had intermittent tenderness over the lower duodenal angle and four have shown transient jaundice The latter finding is of interest in connection with oral cholecystography since many of these cases failed to visualize well at the first examination but later appeared normal In order to ascertain the incidence of this condition in private hospital type of patients, we reviewed our cross files of gastrointestinal examinations during the past five years In this interval slightly under two thousand complete gastrointestinal, including gall-bladder, examinations were performed Eighty (approximately 4%) showed evidence of duodenal stasis of sufficient degree to warrant comment in the fluoroscopic notes

It is well to stress here the importance of fluoroscopic observations in detecting these cases In our experience films alone may not demonstrate the disturbance, particularly in mild cases Of these eighty cases ten were frankly obstructive in nature Six of these were the result of definite anomalies in duodenal attachment with adventitious bands or veils Of the remaining four, two were attributable to intrinsic tumors at about the duodenojejunal junction, of the two remaining, one was the result of aberrant pancreatic tissue, while the other was the result of extreme traction on the ligament of Treitz by a polycystic kidney enlargement

The remaining seventy cases may be divided into the reflex or symptomatic and the so-called idiopathic types We realize that subobstructive lesions such as arteriomesenteric or mesocolic traction have been incriminated as etiologic factors in stasis The evidence of their influence in our group is not impressive and while we cannot entirely negate them as contributing factors, neither can we, on our evidence, accord them the importance suggested by others [3 8]

By reflex types we understand those cases which show clinical and radiographic evidences of duodenal stasis accompanying pathology elsewhere, usually in the abdomen These individuals are quite apt to have other signs, e g , spasticity at the cardia, pylorus or ileocecal valve They practically never have the degree and persistence of stasis found in the so-called idiopathic group The constitutional type, clinical history, and the demonstration of definite organic pathology usually serve to differentiate

Of thirty-eight cases of this type the following pathological conditions were demonstrated gall-bladder pathology, fourteen, postpyloric ulcer, eight, persistently fixed, tender cecum with failure of appendix to fill even after saline barium mixture, six, extreme arteriosclerosis, six, acute gastroenteritis, two, lead poisoning, two

The exclusive causal relationship between the proven pathology and duodenal stasis may be questioned particularly in the gall-bladder, ulcer, and appendix groups Certainly the degree of stasis was greater than that usually encountered in these conditions and it is possible that the pathological conditions simply lead to the aggravation of a latent sympathetic automatic imbalance in a predisposed individual

In the ulcer group we are justified in suspecting that the stasis preceded the ulcer, the latter developing on the basis of duodenitis secondary to stasis There is also some evidence that stasis may precede and possibly cause gall-bladder disease

The arteriosclerotic and lead poisoning cases showed some similarities in their erratic jejunal motility as well as their duodenal manifestations We interpret the findings as the result of alterations in the musculature, extrinsic nerves or intramural ganglia.

The thirty-two remaining cases constitute the so-called idiopathic group It is in this group that we are particularly interested at this time These cases are classical both in habitus and symptoma-

tology As noted above mechanical factors have been incriminated in their causation It is our feeling that the symptomatology and roentgen findings do not fit with the constancy of mechanical conditions It is only by some stretch of imagination that we can blame a fine veil or band for symptoms which come and go, are absent for months on end and are precipitated by fatigue, dietary indiscretion or sleeping in a draught Admitted that ptosis is almost constantly present in these people, so it is in many others without symptoms These people have had ptosis all their lives They have also had their constitutional predispositions since birth and it is our feeling that the exponents of the ptosis theory have neglected the more important constitutional factor of nervous instability These people are almost exclusively the so-called sympathetico-tonic type Their erratic vasomotor system, tachycardia, etc, all point to increased sympathetic activity

With this consideration in mind logical treatment requires either sympathetic depression or vagal augmentation Before entering a discussion of this treatment it is well to say that prior to its institution every form of medical and surgical treatment had been tried on some of these patients Bed rest, belts, knee-chest position, duodenal drainage and ketogenic and acid ash diets were tried along with most of the drugs in the pharmacopeia In mild or moderately severe cases improvement occurred The life of the severe cases was one of chronic invalidism Despite continuous medical treatment these patients had repeated recurrences of their attacks

A short case history of the first patient treated by the physiologic method might be of interest

Single, white, female, school teacher, age twenty-seven In 1931 during an attack of mumps the patient developed upper abdominal pain and tenderness which was thought to be pancreatitis However, following recovery, the pain persisted and on February 11, 1932 the appendix was removed. Postoperative vomiting continued for six days and finally ceased after gastric lavage and saline hypodermoclysis Following operation the patient was confined to bed for ten weeks During this time her upper abdominal pain was relieved only by vomiting She was able to vomit and relieve herself only by eating a fairly large meal which after an hour or so of distress was regurgitated and relative comfort established. Eating no meal or small amounts left her in distress all day Medical treatment, bed rest, atropin and duodenal drainage gave no lasting relief Visual fields, spinal puncture and neurological examinations were negative. Medical consultation settled on a diagnosis of hysteria and the symptoms were overridden with sedatives At the end of the ten weeks interval the patient's weight was stationary at ninety-five pounds and vomiting was reduced to once or twice a day

During the following year the patient taught part-time, spent all holiday periods in bed and had continuous upper abdominal pain associated with occasional vomiting In October 1934 after six weeks of full-time work the patient's symptoms reached a level demanding active treatment. At this time physical exhaustion was so outstanding that Swingle's adrenal extract was administered over a two week interval The symptoms continued unabated. Anesthesin by mouth, daily injections of histamin, bed rest, and dietary measures were unavailing and the patient's weight, which had reached one hundred and three pounds fell to eighty-six. Some relief was obtained with physostigmine but this was transient. Further x-ray studies revealed marked duodenal stasis and erratic motility in the upper loops of jejunum Operative procedures were suggested but not urged and under further medical treatment the patient led an up-and-down course until December 1935 Much of this time was spent in bed. On one occasion blood was vomited During this interval many therapeutic preparations were tried Adrenalin and epinephrine gave transient relief from pain but relapses occurred shortly and with greater severity Sodium dehydrocholic acid intravenously produced transient benefits At this time (December 1935), 100 Mg of acetylcholine was administered Nausea and pain ceased immediately Vomiting continued for a short time but became selective for those foods containing considerable roughage A series of fifteen daily doses of 100 Mg each was administered By January 1936 the weight had reached one hundred and eight pounds, all vomiting and discomfort had disappeared, appetite returned, and the patient had returned to full-time teaching Subsequent history but confirms the association of acetylcholine with the cure. A dose is required at intervals of about six weeks. The indications are upper abdominal distress.

reduction in size of meal taken, restriction of diet to cereals, loss of weight, vomiting The progress can be reversed at any point and the patient restored to her normal condition with a dose of acetylcholine

In contradistinction to this severe case let us consider a very mild one

R. W, white schoolgirl, age twenty-one, entered the hospital with a diagnosis of chronic appendicitis There was no previous history of an acute attack nor was there any right lower quadrant tenderness Her chief complaint was mild nausea and loss of appetite extending over the past six weeks The condition came on following a mild upper respiratory infection and on one or two occasions she had vomited X-ray examination revealed an entirely normal tract aside from undue puddling, reverse peristalsis, and slight dilatation in the duodenal loop Complete disappearance of symptoms followed immediately upon the injection of 100 Mg of acetylcholine The dose was repeated on four successive days and the patient has been entirely well for the past four months

In all, fourteen traceable cases have been treated with acetylcholine injections There have been two failures One in a woman who has been subject to many previous operations including duodenojejunostomy and jejunojejunostomy In this instance it may be that the operative procedures have produced irremediable alterations in physiology At this time we have no explanation for failure in the second case The remaining twelve cases treated have shown complete relief Some of them show a tendency to recurrence of symptoms but an occasional injection restores them to good health

Fluoroscopic examination following a course of treatment reveals a return to normal in all save the severe cases In these latter some residual erratic motility remains Whether future experience will support the present high percentage of success or not remains to be seen However, we have every reason to believe that in properly selected cases where no definite causative pathology is present most cases will respond favorably

Acetylcholine bromide, the drug principally used in this series, is available as a white crystalline powder, the crystals clumped together and adherent to the sides of the ampule in which it is dispensed It is deliquescent, freely soluble in water, in which medium it is usually administered It must be protected from the air when in powder form and administered promptly when dissolved It has a rather putrid odor It has not been accepted by the Council on Pharmacy and Chemistry of the American Medical Association

The standard individual dose used in the series is 100 Mg dissolved in sterile distilled water and administered subcutaneously Administration by mouth is barred not only by the rapid destruction of the drug in the intestine but also by its nauseous taste Intramuscular injections have no advantages over the subcutaneous route and intravenous injections have caused distress and have been warned against Physiologically the drug has been classed as a stimulant of the parasympathetics In the laboratory it slows the heart, dilates the peripheral blood vessels, and constricts the bowel

While acetylcholine is probably present in every tissue in the body it is found in greatest amounts in the spleen, placenta, and adrenal cortex It has been proved to be the substance liberated at the nerve endings in the stimulated parasympathetic nerves Epinephrine, or an identical substance, is released at the nerve endings of postganglionic sympathetic nerves To this extent, and where sympathetic and parasympathetic functions are antagonistic, epinephrine and acetylcholine are physiologically opposed Acetylcholine, however, is released at the ganglionic synapse by both the sympathetic and parasympathetic preganglionic nerves It has, therefore, a part in the sympathetic impulse progression It resembles histamin physiologically in part and differs from this drug in that, when used in small doses, its action is abolished by atropin while that of histamin is not. This effect is due to the action of the atropin at the muscle bundle Larger doses of acetylcholine override the suppressing effect of atropin and act as a stimulant to the ganglion cells of both the sympathetic and parasympathetic systems Used with atropin it may become a stimulant of the sympathetic system While the action of the drug is rapidly stopped by an esterase present in muscle and in the blood it can again be activated by acetylating the res-

idue It is, therefore, inactivated but not destroyed In the experimental laboratory, eserine blocks the inactivating action of the blood Physiologically the effect of the drug on the human is exhausted on the blood vessels in one minute and on the intestine in ten minutes

We have difficulty fitting these facts into the excellent clinical results obtained in the series of cases and in this particular disease entity We offer as an explanation the following hypothesis

First, that the condition is a form of nerve exhaustion They are the type of individuals who require constant change of pace Periods of intense effort, periods of utter relaxation, eager to carry the world's burdens today, resentful of all responsibility tomorrow

Second, that the factor which has been exhausted is a substance used in the synthesis of acetylcholine at the nerve ending

Third, that acetylcholine bromide, as administered by us, is quickly inactivated by the blood and in its inactivated form becomes available to, and is stored by the nerve

The dose of the drug at any age, in both sexes and with any size individual is the same—100 Mg subcutaneously daily until relief is obtained, every second day until slight flushing follows the dose, then discontinue the drug and wait for a return of symptoms to determine a period within which a dose must be given to continue the results

None of the three cardinal symptoms of physiologic action—slow pulse, dilatation of peripheral blood vessels as evidenced by lowered blood pressure, flushing or sweating or contraction of the bowel—have been noted except that when we have established relief of the symptoms we look for flushing as a sign that enough of the drug has been administered The very absence of these symptoms suggests that our hypothesis as to the mode of action of the drug in this condition is wrong and that what we are really dealing with is increased esterase activity which rapidly hydrolyses acetylcholine and our therapy absorbs or diverts this excess and leaves the postganglionic parasympathetic nerve free to exert its action at the muscle plate.

We have used the drug following the administration of histamin in the treatment of ulcer complicating the duodenal puddling We have used the drug in conjunction with atropin and feel that there may be some advantage in this despite the fact that atropin abolishes the action of the drug in part This counteraction takes place at the muscle If either the hypothesis of the replacement of an exhaustible substance or the thought that we may be diverting an overactive esterate is correct then this counteraction by atropin at the muscle is of advantage because it abolishes the unpleasant and unwanted physiologic action of the drug

We have used eserine in conjunction with acetylcholine and do not feel that it has in any way improved the action of the drug We feel sure that morphine is incompatible. In the one case in which morphine was used in conjunction with acetylcholine the results were poor and no relief was obtained When one recalls the action of morphine upon the bowel as observed on roentgenologic examination the incompatability becomes apparent.

During the last calendar year 1,869 physicians of New York State were authorized to practice in workmen's compensation cases, Industrial Commissioner Andrews announces This brings the total number of such authorized physicians to 15,672 out of 21,880 licensed to practice medicine in the state

The French deputy who had a scheme for the compulsory retirement of all doctors at the age of sixty-five raised such a storm that he has modified it, and now would oblige all liberal professions and associations to provide pensions at sixty-five and permit doctors to retire on them or not, as they wish

PROSTATIC DISEASE

Determination of the Method of Treatment

ROY B HENLINE, M D , F A C S , *New York City*
From the Department of Urology (James Buchanan Brady Foundation) of the New York Hospital

Enlargement of the prostate presents so many variations that every means at our disposal should be employed to determine the exact nature and extent of the disease before surgery is instituted No single diagnostic procedure gives sufficient information concerning the exact location and extent of the obstructing tissue. Only when all the data about a prostate are assembled can the proper treatment be instituted It is advisable for us to use any method of diagnosis which adds materially to our complete understanding of the size, location, extent, and character of the obstructing tissue The surgical method employed in each patient should be the one which will adequately remove the obstruction, cause the minimum shock to the patient, and interfere least with the normal tissue in approximation to the obstruction, and hence leave the patient with the best functional result We, as urologists, should be capable of performing perineal and suprapubic prostatectomies as well as transurethral resection since each of these surgical procedures should be used in certain patients to obtain the best results

Etiology

The cause of prostatic hypertrophy and the glands from which prostatic enlargement develops are still much disputed points There are two general groups of prostatic glands usually referred to as the external glands which are the true functioning prostatic glands, and the internal glands which are superficially located in the posterior urethra and extend only into the mucosa and submucosa The external or functioning prostatic tissue develops into five separate groups of glands or lobes, according to Lowsley,[16] who in his work on the histology of the prostate published in 1911, estimated that there existed between fifty and seventy direct orifices emptying into the prostatic urethra from these five external lobes He also described the internal group of glands which are superficially located in the mucosa and submucosa of the prostatic urethra and trigone This latter group of glands, although insignificant in size, are believed, by Tandler and Zukerkandl[30] as well as others, to be the site of origin of all hyperplasia of the prostate and they believe that such enlargements never arise from the external functioning glands Marion[30] accepts this point of origin Young[30] states that there are five common sites of origin of prostatic hypertrophy consisting of groups of submucosal glands on the sides and floor of the urethra and trigone (Fig 2)

However, Randall,[22] in his recent pathological study (1931) of 1215 postmortem prostatic specimens, believes that adenoma or hypertrophy may arise from any of the prostatic glands There is evidence in his pathological specimens to substantiate his belief and make it difficult to conceive how certain types of prostatic hyperplasia could originate in the periurethral or submucosal glands Deming[10] doubts that all cases of prostatic hypertrophy arise from the submucosal glands The site of origin and progression of prostatic hyperplasia becomes important in the determination of the proper surgery to employ in each patient

Wesson[28 29] and Lowsley have demonstrated that the mucosal and submucosal glands on the floor of the posterior urethra are separated from the true prostatic glands by the extension of the trigonal muscle Surgically, and from pathological specimens, we find

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

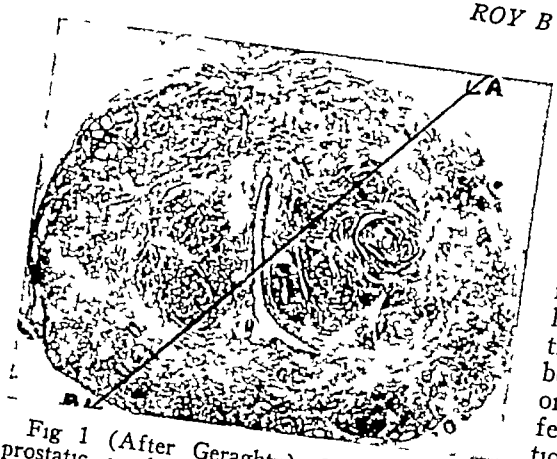

Fig 1 (After Geraghty) Cross section of prostatic urethra with moderate lateral lobe enlargement Note anteroposterior elongation of prostatic urethra Urethrogram will show spread of posterior urethra only if taken at an angle as shown by line A-B This is done by turning the patient's pelvis at an angle of thirty to forty-five degrees

situated just beneath the muscles of the posterior urethra This would adequately explain the central origin of hypertrophy and yet account for certain specimens in which the prostatic enlargement (notably median commissural hypertrophy) is present apparently under the trigonal muscle and elevates the posterior vesical lip If the trigonal muscle does lie above the median lobe hypertrophy, as Wesson[9] believes, either suprapubic prostatectomy or transurethral resection would interfere with and probably destroy the function of the trigone in urination

Infection unquestionably is a factor in the production of prostatic bars The importance of infection in hyperplasia of the prostate is still unsettled Carcinoma of the prostate almost invariably arises in one of the external prostatic glands, about seventy-five per cent in the posterior lobe [20-23] Lower believes that a testicular hormone is responsible for prostatic hypertrophy Moore[19] has shown, not only with animals but in one man who had been castrated, that involution of the prostate apparently resulted from a decrease and cessation of the same internal secretion of the testes which appeared at puberty

The examination of the prostates of twenty-five eunuchs who lived past the age of forty-five has failed to reveal any evidence of prostatic hypertrophy [19] Although prostatic enlargement may be initiated by a hormone from the testes, there is evidence, according to Young and Moore,[18] that removal of the testicles does not cause atrophy of the hypertrophic tissue

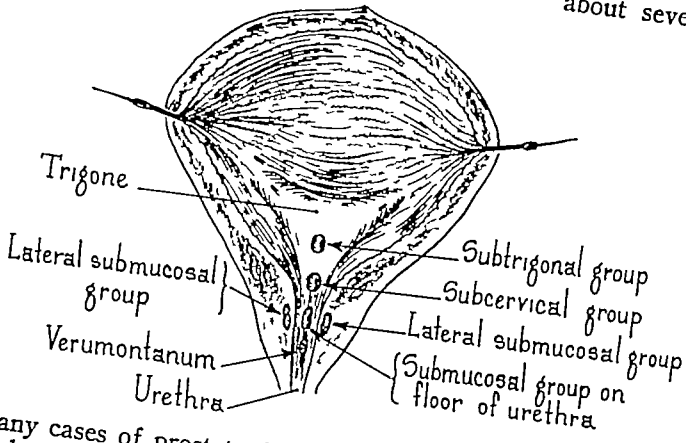

Fig 2 Location of five submucosal groups of glands where prostatic hypertrophy develops according to Young

many cases of prostatic hyperplasia lying under the trigonal muscle and it is difficult to understand how such a specimen could have its origin in the superficial mucosal glands and extend to lie completely encapsulated under this muscle Just which glands actually comprise the so-called internal group of glands may be confused by different observers Moore[19] considers the internal group of glands to be composed of not only the submucosal glands but also the shorter and more superficial true prostatic glands which extend beyond the muscle layer and yet are centrally located He believes that most cases of prostatic hypertrophy (excepting subcervical and subtrigonal lobe hypertrophy) develop from the small short external functioning prostatic glands,

Types of Prostatic Enlargement

Although one realizes that the many different forms of prostatic enlargement will defy absolute classification, yet it is convenient for many reasons to differentiate the usual types met in every day practice It is desirable to classify these tumors according to the pathology present since the necessity for treatment depends so largely on the location, type, and extent of the pathological process It is not sufficient to determine that a patient has an obstructing prostate which requires surgery A pathological classification of the condition present enables one to select intelligently the rational surgical treatment

It is our purpose to bring to your attention some aerograms and cystourethrograms, a simple method of examination which will aid in determining the size of the prostate and the location and extent of the obstructing tissue I have attempted to correlate these findings not only with the pathology found in the usual types of prostatic obstruction, but with the other diagnostic methods at our disposal Randall's recent study of 312 obstructing prostates found at autopsy revealed eight main types of prostatic enlargement. Although there were many stages of progression for each type of enlargement, yet these eight general varieties may be differentiated for surgical purposes A brief review of these pathological varieties of prostatic enlargement is presented

The first type found in ten per cent of Randall's specimens was simple bilateral hypertrophy This type was entirely extravesical or intraurethral and completely encapsulated, and the lateral lobes were entirely separate from each other These lobes may enlarge and herniate through the urethra into the bladder, yet they usually remain distal to the internal sphincter, lift the bladder up, and remain extravesical

The second type is termed solitary posterior commissural hypertrophy (middle lobe) which was also present in ten per cent of the specimens This enlargement occurs in the median lobe of the prostate and anatomically is under the trigone and circular muscles of the internal vesical sphincter This so-called middle lobe may be directly connected with each lateral lobe.

The third group is the bilateral and posterior commissural hypertrophy which occurred in 12 per cent of his series This is a combination of the two previous types and shows many variations because of unequal growth in the gland, which frequently protrudes into the bladder

The fourth group or solitary subcervical hypertrophy occurred in twenty-two per cent of the specimens This type unquestionably arises from the submucosal or internal prostatic glands, is superficial to the internal sphincter and trigonal muscle, and covered only by mucous membrane

The fifth type is a combination of bilateral and subcervical lobe hypertrophy and occurred in sixteen per cent of the specimens This is the true trilobar prostatic enlargement where the submucous subcervical lobe, often pedunculated, is separate from the enlarged lateral lobes

Median bars, the sixth group, comprised eighteen per cent of the prostatic obstructions and is a true fibrosis present as an abrupt elevation on the floor of the vesical outlet.

The seventh group was carcinoma and occurred in about 5 5 per cent in this series

The remaining five per cent of prostatic obstructions, comprising the eighth group, were caused by abscesses in the prostate (Table I)

Symptoms

Unfortunately the onset of symptoms from prostatic diseases is often so insidious that patients may be unaware of any difficulty until a sudden urinary retention develops The symptoms of diminished urinary force, frequency, and particularly nocturia are usually so gradual in their onset that many men believe this is a necessary inconvenience due to their age [27] Early symptoms which should lead one to examine the prostate are increasing effort to start the flow, decreasing force of the stream, increase in the time required to void with diminution in the calibre and length of the urinary stream, hesitancy and interrupted or intermittent flow The prevalence of prostatism demands that the prostate should be examined in anyone presenting these symptoms Although at present prostatic hypertrophy cannot be prevented, the serious consequences of the advanced stages are preventable It is estimated that twenty-five to thirty-five percent of men past fifty years of age have a prostate sufficiently enlarged to

TABLE I

Common Types of Prostatic Enlargement (Randall)	Usual %	Rectal Examination	Residual Urine	Catheter Passes	Cystourethrogram	Cystoscopy	Preferable Surgery
Simple Bilateral	10	Large Smooth with distinct median sulcus	Occurs late, often small, intermittent.	Usually easily	Straight, spread elongated posterior urethra. Diag nostic.	Inverted V and lateral intraurethral intrusion.	Perineal prostatectomy or resection.
Solitary Posterior Commissural	10	Little or no enlargement.	Occurs early, constant.	Difficult, bleeds easily false passage frequent	Normal post. urethra except gradual anterior angulation and soft tissue shadow at vesical orifice (Usually Diagnostic.)	No inverted V, broad bulging at vesical orifice	1 Resection 2. Perineal or suprapubic.
Bilateral and Commissural	12	Large, broad, smooth with little or no median sulcus.	Early, large amount, constant.	Usually difficult, bleeds easily, false passage easy	Long, spread post. urethra, gradual curve at vesical orifice intravesical soft tissue shadow Diagnostic.	Inverted V, broad bulging floor at bladder neck and lateral intraurethral intrusion. Often not necessary or advisable	1 Resection 2. Perineal or suprapubic
Solitary Subcervical Lobe.	23	Not enlarged	Sudden retention, may be intermittent.	Usually easily	Normal post. urethra except abrupt anterior angulation and rounded soft tissue shadow at vesical orifice usually diagnostic.	Post. urethra normal except rounded mass on floor of bladder neck, often pedunculated.	1 Resection 2. Suprapubic
Bilateral and Subcervical Lobe.	16	Large smooth, moderate median sulcus.	Develops slowly to retention — constant	Much variation, bleeds easily	Long, spread post. urethra, abrupt anterior angulation and rounded soft tissue shadow at vesical orifice, diagnostic.	Inverted V rounded, often pedunculated, mass on floor of bladder neck and lateral intraurethral intrusion. Often not necessary or advisable.	1 Resection 2. Suprapubic
Median Bars	18	Not enlarged	Usually small	Easily	Triangular posterior urethra with anterior angulation at bladder neck, usually diagnostic.	Abrupt firm elevation at floor of bladder neck.	Resection
Carcinoma	5 5	Moderate enlargement with small hard nodule to irregular stony enlargement	Early none — later retention.	Early easily — later very difficult	Elongated, narrow, irregular post. urethra. Usually suggestive or diagnostic.	Early normal — later difficult, hard irregular urethra and bladder neck from extension.	1 Early, radical perineal prostatectomy 2. Late, resection
Abscess	5	Enlarged soft fluctuates, later firm.	Varies greatly	Usually easily	Cavity outlined if connected with urethra. Diag nostic.	Not advisable early— later many variations.	Perineal drainage

be producing obstructive symptoms [6-13] This condition should have the attention of internists and general practitioners since they are usually first consulted when the early symptoms are present It would make the task of relieving prostatic obstruction much more safe and simple if patients could be seen in the earlier stages of prostatic disease, before the damage to the heart and kidneys has progressed beyond repair As McCarthy[17] has appropriately said, "To substitute urinary antiseptics in frequent urination, especially nocturia, for the critical examination of the qualified urologist, is a violation of trust"

Methods of Diagnosis

Rectal Palpation

Palpation of the prostate by rectum is the oldest and still a most valuable diagnostic aid However, one can be entirely misled by this finding alone In Randall's 312 specimens with prostatic enlargement, fifty per cent showed no enlargement by rectal examination In 254 patients with prostatic obstruction, examined by Young,[30] the impression concerning the size of the prostate was incorrect in sixty-one per cent Although this percentage seems higher than we would expect, yet it serves to remind us of the frequent necessity for further examination to determine the presence of prostatic obstruction Randall's cases which showed no appreciable enlargement on rectal examination were median bars, eighteen per cent, solitary subcervical lobe, twenty-two per cent, and solitary posterior commissural hypertrophy ten per cent It

cannot be too strongly stressed that rectal palpation of the prostate alone is insufficient evidence to rule out obstructing prostatic pathology

In simple bilateral prostatic hypertrophy, large lateral lobes are palpable by rectum with a distinct and rather deep median sulcus When commissural hypertrophy is present with bilateral lobe enlargement, the rectal examination presents the same findings except a very shallow median sulcus which may almost be absent at times, together with a broader prostatic base With bilateral and subcervical lobe enlargement, the median sulcus is slightly more pronounced but the base of the prostate is less broad The characteristic feeling of a prostatic abscess depends on its duration and acuteness Early in the infection the prostate is soft and fluctuates, but, if the abscess becomes walled-off with surrounding fibrosis, the prostate is more firm to the touch and later it may be difficult to differentiate from a hypertrophic prostate.

Careful rectal examination is essential for the early diagnosis of carcinoma of the prostate Unfortunately, there often are no symptoms to make either the patient or the physician aware of an early prostatic carcinoma, as it is only when the bladder neck becomes involved, causing urinary symptoms, that attention is directed to the prostate When, during a routine prostatic palpation, a firm nodule is felt, regardless of how small, further examination should be undertaken to determine whether an early cancer may be present When one feels a hard, irregular, board-like or stony-hard prostate, the diagnosis of carcinoma becomes simple, yet at this stage any form of treatment is only palliative

Residual Urine

Incomplete emptying of the bladder is one of the primary reasons for surgical intervention in prostatic disease Urinary retention is one of the common findings in most types of enlargement of the prostate, yet one often finds large simple bilateral lobe hypertrophy with little or no residual urine Early median bars and carcinoma often have no residual urine The urine which remains in the bladder after voiding is a danger signal

Fig 3 Age thirty-two, Normal posterior urethrogram, note spindle shape, ends being internal and external sphincters, and central widest portion with verumontanum outlined. Posterior urethra is straight

Fig 4 Age sixty-nine, Urinary symptoms more than four years with sudden retention, rectal, large smooth with median sulcus, catheterized easily, note soft tissue shadow which appears to be median lobe but urethrogram shows straight, spread, elongated posterior urethra. *Large lateral lobes present* protruding into bladder

and the primary cause for progressive damage to the kidneys The larger the quantity of residual urine, the greater the necessity for immediate surgical intervention However, the amount of urinary retention is not the only criterion for surgery, since early carcinoma, median bars, abscess, and occasionally simple bilateral and solitary subcervical lobe hypertrophy may have little or no residual urine, yet require surgery for their relief We are sufficiently aware of the progression of these lesions to advise early treatment before serious irreparable damage has occurred Usually the quantity of residual urine can be determined by having the patient void, then passing a catheter to the bladder to drain whatever urine remains This may not be required in each case since Beer[1] has demonstrated a simple method for estimating the residual urine by permitting a patient to void just before the last intravenous urogram is taken and judging the retention by the quantity of contrast media remaining in the bladder

Catheterization

A suspicion of the type of prostatic enlargement may be obtained by passing a catheter into the bladder Many obstructing prostates readily admit a catheter When difficulty in inserting a catheter is encountered, unless there has been previous urethral trauma, one suspects the presence of a commissural hypertrophy, a subcervical lobe with bilateral lobe enlargement, or a carcinoma The bleeding which frequently occurs when catheterizing these patients usually results from the trauma to the encroaching prostatic enlargement on the floor of the vesical orifice As the catheter approaches this obstruction at the bladder neck, its course is diverted at an anterior angle to enter the bladder Since prostatic adenoma has less elasticity than normal tissue, false passages frequently occur in these obstructions A semilateral cystourethrogram readily demonstrates this anterior angulation at the vesical orifice (Fig 5)

Aerograms and Cystourethrograms

Cystourethrograms in conjunction with aerograms add another valuable method of diagnosis in enlargement of the prostate Each type of prostatic enlargement produces a characteristic distortion of the prostatic urethra and bladder neck which in most cases permits one to determine the type and extent of the obstruction A cystourethrogram can be made with very little discomfort to a patient and frequently makes it unnecessary to perform a cystoscopy A permanent record may thus be obtained which is of particular value in progress examinations

Fig 5 Age fifty-nine, Urinary symptoms four years, rectal, very slight enlargement, note soft tissue shadow at vesical orifice and *Anterior Angulation* of catheter, *Posterior Commissural Hypertrophy*

Although Wulff[11] described the first opaque cystogram in 1905 and Keller the first air cystogram in 1904, it was not until 1910 that Cunningham[9] first reported urethrograms using fifty per cent argyrol as a contrast medium to demonstrate urethral strictures Haudek, in 1921, demonstrated that the posterior urethra could be satisfactorily visualized by injecting opaque fluid during the exposure of the radiogram and Sicard and Forestier[25] used lipiodol for this purpose in 1924 Flocks[11] (1933) substituted a lipiodol gum tragacanth jelly for urethrograms and outlined a definite technic for visualization of the prostatic urethra

He stated that the ideal contrast media should give the maximum opacity with minimum irritation, be homogeneous, have low toxicity even if injected intravenously, rather viscid, yet water soluble so that it could easily be washed out A rather viscous mixture is desirable so that each crevice may be filled and yet with inertia enough to keep the urethra completely filled while the x-ray is being taken A watery solution will be partly expelled by the muscles of the posterior urethra and the urethrogram will lose its

Fig 6 Age sixty-three, Urinary symptoms five years with constant residual urine, rectal, very slight enlargement, note soft tissue shadow and *Anterior Angulation* of contrast media, *Posterior Commissural Hypertrophy*

value Flocks also drew attention to the contrast obtained when using an opaque solution for the urethrogram in combination with air cystograms Gillies and Kerr[12] (1935) reported more than two thousand combined aerograms and urethrograms done in Alcock's clinic with no untoward symptoms referable to the procedure. Nesbitt[21] has used the same technic, substituting hippuran jelly for lipiodol, in over 500 cases with no complications He believes that with aerograms and cystourethrograms properly done, one may determine quite accurately the type and extent of the obstructing prostate making cystoscopy rarely necessary We have been using hippuran jelly as suggested by Nesbitt because it is more water soluble than lipiodol and may more readily be washed out of the bladder and urethra following the urethrogram, although some of the accompanying urethrograms were made with lipiodol jelly

Technic

A plain x-ray of the bladder and kidneys is first taken A small soft rubber catheter (size F 14 to 16) is passed to the bladder and the residual urine drained and measured The bladder is filled to the point of fullness, but not discomfort, with a 2 5 per cent solution of sodium iodide, and an x-ray taken with the patient in the dorsal position If a diverticulum is suspected, a lateral x-ray may also be made The sodium iodide is allowed to drain out and the bladder filled with air until the patient has the first sensation of bladder fullness The pelvis of the patient is then turned to an angle between thirty and forty-five degrees, the left (under) thigh flexed to a forty-five degree angle, and the right (top) thigh extended A stereoscopic aerogram is taken with the catheter still in the bladder and the x-ray tube centered over the base of the bladder The patient remains in the same position and the catheter withdrawn as the end of the penis is compressed with the fingers to prevent the air from escaping from the bladder A fifty c c luer syringe, to which the distal two or three inches of a soft rubber catheter has been attached, is filled with hippuran jelly This portion of the catheter is inserted into the urethra holding the urethra firmly around the catheter and the jelly gently injected into the urethra and bladder until about twenty to twenty-five c c. of jelly has been injected During the last of the injection another stereoscopic x-ray is taken The air and jelly may then be voided or washed out by reinserting the urethral catheter

The hippuran jelly used by Nesbitt and which we have found satisfactory is as follows

Hippuran NNR	640 0 G
Tragacanth U S P Ribbons	48 0 G
Glycerin U S P	765 0 C.C
Acid Boric U S P Crystals	120 0 G

Odor (Sp Lilac etc.) or alcohol	25 0 C C.
Nipasol M (Preservative)	1.2 G
Aqua Distellata q s.a.d.	4000 0 C.C

Mix the glycerin with 1800 c.c. water In this dissolve the boric acid with aid of heat. Soak the tragacanth in the acid glycerin mixture until swelling is complete Then dissolve the hippuran in 700 c.c. water and add to gum mixture Dissolve the Nipasol M in the odor and add to mixture while stirring Add water to make final volume Strain and bottle.

The proper consistency of this jelly is essential for the best results The jelly should be rather thick yet sufficiently liquid to pass out of the syringe and through the tip of the catheter without using too much force The opacity of the fluid may be increased by adding more hippuran, or a small amount of ten percent sodium iodide solution A jelly made entirely of sodium iodide often causes some irritation along the urethra.

Interpretation of Cystourethrograms

The plain x-ray is taken to determine the presence of shadow-casting stones in the genitourinary tract and to visualize the kidney outlines Spina bifida or metastatic bone lesions may be noted

The cystogram with a dilute solution of sodium iodide permits one to outline the contour of the bladder The normal bladder is rounded and smooth and somewhat larger than a grapefruit Any distortion of this smooth outline indicates a pathological condition among which may be noted stones, bladder tumor, or prostatic intrusion at the bladder neck Diverticula or cellules are seen which often result from prolonged urinary obstruction A relaxed internal vesical sphincter which permits the prostatic urethra to be filled with contrast media appearing as a funnel at the vesical outlet suggests injury to the internal sphincter, spinal injury, tabes, or other neurogenic dysfunction

The stereoscopic semi-lateral aerogram with the catheter in position permits the soft shadow of any prostatic intrusion into the bladder to be visualized It is particularly important to have the x-ray tube centered over the base of the bladder (bladder neck) If the x-ray tube is centered above the bladder neck, the soft tissue shadow of the intravesical prostatic intrusion will be exaggerated and appear to be larger than it is Since the prostatic urethra is straight, the soft rubber catheter enters the normal bladder neck without any curvature In the presence of a median commissural hypertrophy or any other definite obstruction of the posterior vesical lip, an anterior angulation of the soft rubber catheter is noted in the x-ray taken in the semi-lateral position The stereoscopic study permits one to visualize and estimate the size with reasonable accuracy of the intrusion of each lateral and the median prostatic lobes Retentive diverticula remain filled with sodium iodide solution and are outlined by the contrast with the aerogram

The normal posterior or prostatic urethra extends from the external to the internal sphincter and usually is between three and four cm in length The walls of the urethra are in contact except during micturition The posterior urethra is distended and its outline obtained by injecting the contrast media while the x-ray exposure is being made The normal posterior urethra is spindle-shaped, the ends of the spindle being formed by the external and internal sphincter, while the central widest portion shows a rounded eminence near the external sphincter caused by the verumontanum The cystourethrogram is of value in determining prostatic disease because of the intimate relationship of the prostate to the urethra It is evident that any change in the size and shape of the prostate will distort the urethra and become evident in the cystourethrogram (Fig 1)

The deformity noted in cystourethrograms with this technic depends upon the change which has taken place in the prostate Lateral lobe hypertrophy develops on each side of the prostatic urethra and while pressing on the urethra causes it to become a longitudinal slit with a marked increase in the anteroposterior diameter. It is because of the change in the shape of the urethra to a longitudinal slit that a semi-lateral cystourethrogram is necessary to determine the extent of the lateral lobe prostatic hypertrophy responsible for this flattening of the posterior urethra (Fig 1) The length of the prostatic urethra is also increased which aids in estimating the size of these prostatic lobes The

contrast between the hippuran jelly as it enters the bladder with the air in the bladder and the soft tissue shadow of the prostatic intrusion permits an outline of the obstruction (Fig 4)

The appearance of a cystourethrogram in a simple bilateral prostatic hypertrophy shows the prostatic urethra to be widened or spread out between the membranous urethra and the bladder neck The extent of this spread with the increased length of the prostatic urethra permits one to estimate the size of the lateral lobes since the lateral lobes alone are responsible for this increased width and length of the prostatic urethra The soft rubber catheter in the aerogram in simple bilateral hypertrophy shows no anterior angulation and the hippuran jelly enters the bladder without any deviation on the floor of the bladder neck A soft tissue shadow may be seen as a rounded mass protruding into the bladder neck and this frequently is mistaken for median lobe hypertrophy This mass occurs as the lateral lobes increase in size and elongate the posterior urethra to press against and elevate the internal sphincter at the bladder neck It may be differentiated from a median lobe by the lack of curvature noted in the soft rubber catheter in the aerogram, by the lack of angulation of the contrast media in the cystrourethrogram or by stereoscopic examination

A solitary posterior commissural hypertrophy (middle lobe) is suspected by the anterior curvature of the soft rubber catheter in the semi-lateral aerogram From the stereoscopic aerogram the size of the median lobe obstruction can be seen The cystogram often shows a filling defect at the bladder neck The cystourethrogram shows the prostatic urethra to be practically normal until the contrast media is diverted as an anterior angulation to outline the intruding lobe at the bladder neck (Fig 5-6)

With bilateral and commissural prostatic hypertrophy a combination of these two types are demonstrable The degree of the flattened elongated posterior urethra with the anterior angulation at the bladder neck will aid in estimating the size of the prostate (Fig 7)

A solitary subcervical lobe hypertrophy usually presents no deformity of the posterior urethra in an urethrogram A filling defect may be present in the cystogram, and its size can be estimated with stereoscopic aerograms If this subcervical lobe has a small base, the catheter may pass into the bladder on either side of the obstruction and present little or no anterior angulation in the aerogram Usually, however, the base is sufficiently large to divert the soft rubber catheter anteriorly With the contrast media in the urethra an abrupt anterior angulation is seen as the obstructing rounded mass becomes outlined with its surface covered by the jelly (Fig 8)

A combination of bilateral and subcervical lobe hypertrophy was found in sixteen per cent of Randall's specimens When these occur together a combination of the cystourethrographic findings are present When the base of the subcervical lobe is large, it may be difficult to differentiate from a median commissural hypertrophy, yet the roundness of the subcervical lobe, the acuteness of the angle caused by the contrast media at the bladder neck, and the stereoscopic aerograms are suggestive of a subcervical lobe enlargement (Fig 9)

When median bars are sufficiently large to cause obstructive symptoms, the findings with cystourethrograms are usually diagnostic There is usually no filling defect at the bladder neck in the cystogram If the bar is large enough an anterior angulation of the catheter may be seen in the semi-lateral aerogram The cystourethrogram shows a small yet abrupt elevation at the posterior vesical lip Most of the prostatic urethra is normal but on the urethral side of the bladder neck a triangular spread is seen with the contrast media The normal vesical uvula is replaced by the fibrous bar which causes an upward angulation from the floor of the vesical end of the posterior urethra This sudden drop from the bladder neck to the normal level of the posterior urethra forms one side of the triangular area seen in these cystourethrograms The posterior urethra may appear to be somewhat shortened in length (Fig 10-12)

A cystourethrogram is a distinct aid in the diagnosis of clinical carcinoma of the prostate In an urethrogram the urethra is elongated and irregularly nar-

rowed by pressure around its circumference by the carcinoma, produced by an uneven encroachment on the prostatic urethra A soft tissue shadow is usually seen at the bladder neck in the aerogram Occasionally, the first suspicion of prostatic carcinoma has followed the characteristic findings in the cystourethrogram of an elongated, narrow and irregular prostatic urethra Since the location of the prostatic carcinoma is responsible for the appearance of the urethrogram,

Fig 7 Age seventy-two, Urinary symptoms six months with damaged kidneys, Rectal, moderate enlargement smooth, sulcus absent, note elongated spread posterior urethra with gradual anterior angle at bladder neck. *Bilateral and Posterior Commissural Hypertrophy*

Fig 9 Age sixty-nine, Urinary symptoms for ten years with intermittent retention but constant residual, rectal, very large smooth prostate, note long spread posterior urethra and rather abrupt anterior angulation of contrast media at bladder neck as rounded soft tissue shadow is outlined, *large lateral and large subcervical lobe hypertrophy*

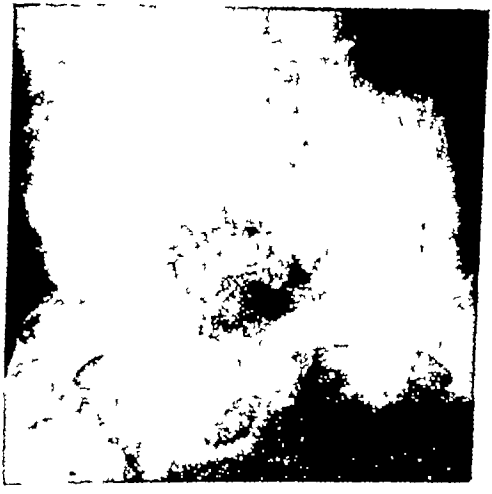

Fig 8 Age forty-nine, Urinary symptoms for one year followed by *Sudden* complete retention, rectal, very slight enlargement, note normal posterior urethra until abrupt anterior angulation is seen at bladder neck as surface of obstructing rounded mass is outlined by contrast jelly *Solitary Subcervical Lobe Hypertrophy*

considerable variation may be noted when the carcinoma is present with hypertrophy or abscess, or when the posterior prostatic lobe only is involved with no extension to the urethra The predominating lesion will be evident in the urethrogram and the presence of carcinoma may not be apparent (Fig 14)

A cystourethrogram of a prostatic abscess, if the abscess cavity communicates with the urethra, shows its size and extent as it fills with the contrast media In prolonged prostatic infections an urethrogram may reveal the presence of a small infected cavity in the prostatic urethra (Fig 13)

I do not wish to suggest that cystourethrograms will take the place of other methods of diagnosis in prostatic enlargement Yet in many patients presenting signs of prostatic obstruction, considerable added information can be obtained by proper semi-lateral aerograms and urethrograms Since this may be so simply done with little discomfort to the patient, it should be more commonly used In approximately ninety per cent of patients with prostatic obstruction, the type and extent of the obstruction may be determined or confirmed with cystourethrograms (Fig 15)

Cystoscopy is often a necessary and distinct aid in the diagnosis of many prostatic obstructions, yet cystourethrograms frequently give as much and occasionally more inforamtion regarding the size, location, and extent of the lesion Patients appreciate the avoidance of cystoscopy whenever it is possible It is neither desirable nor good surgical judgment to cystoscope a patient with complete urinary retention from a large congested prostate unless it is done under anesthesia At times it is impossible to pass a cystoscope into the bladder Bleeding, which occurs frequently with even the slightest trauma, obscures the vision and prevents visualization of the obstruction According to the specimens examined by Randall, cystoscopy would not have been necessary nor desirable in approximately twenty-eight per cent since the correct diagnosis in these cases could have been made with rectal examination and cystourethrograms The judgment to know when and when not to use a cystoscope is a greater asset than the mere ability to know *how* to use it

Fig 10 and 11 Age seventy-four, Urinary symptoms for several years with two to three ounces residual, rectal, irregular from chronic infection, note anterior angulation of catheter with no soft tissue shadow in aerogram, *Triangular Area* in posterior urethra showing verumontanum which seems to be near bladder neck. *Median Bar*

I shall not describe the cystoscopic findings in each individual prostatic lesion It is not unusual for two or more observers to obtain a different mental picture of the size, location, and extent of an obstructing lesion at the bladder neck Two descriptions of the same lesion may disagree in some important points However, whenever cystoscopy is indicated and possible of performance, the type of obstruction can be determined by an experienced cystoscopist

A biopsy of the prostate in a suspected case of carcinoma is often helpful The Lowsley prostatic needle may be employed and enough tissue obtained for pathological study Tissue may also be obtained from a prostatic resection at which time

the bladder neck obstruction can be relieved If a malignancy is discovered from the tissue removed at resection and no extension is demonstrable, a radical perineal prostatectomy may be done If the tissue removed by resection shows no malignancy, the patient requires no further surgery for relief of the bladder neck obstruction

An emergency cystotomy is occasionally required because a catheter for drainage cannot be passed to the bladder Occasionally when a catheter is passed to the bladder, bleeding may be either uncontrollable or may prevent the catheter from draining, requiring the bladder to be opened If this becomes necessary the vesical orifice can be visualized from the cystotomy opening and the diagnosis of the obstructing lesion determined

Treatment

The criterion for proper treatment should not be whether a certain surgical procedure can be done, but rather which surgical procedure is best suited for the

Fig 12. Age forty-three, Urinary symptoms for several years with one to two ounces residual urine, rectal, normal, note *Triangular Area* in prostatic area with anterior angulation of contrast media at bladder neck, note oval shadow behind triangular area, caused by pouch in left lateral lobe of prostate resulting from abscess or false passage. *Median Bar with Pouch in Prostatic Urethra.*

removal of the obstructing lesion which will interfere least with the remaining normal tissue and will re-establish normal bladder function We all realize that either prostatic resection, perineal or suprapubic prostatectomy can be performed in almost every case of prostatic obstruction However, a routine surgical procedure for patients presenting so many various pathological lesions does not appear justifiable even though the results and the low mortality from prostatic resection in experienced hands makes this procedure the one of choice in most cases [2 5 21] An intravesical prostatic enlargement can be removed through the perineum but to remove it in this manner is not only more difficult, but it disturbs the normal surrounding tissue and may interfere with the future bladder function A simple bilateral intraurethral hypertrophy may be removed suprapubically, yet because of the location of the enlargement, a perineal prostatectomy should interfere less with the internal sphincter and the trigonal muscle

Most urologists agree that fibrous prostates, median bars, and obstructive prostatic carcinomas with extension are

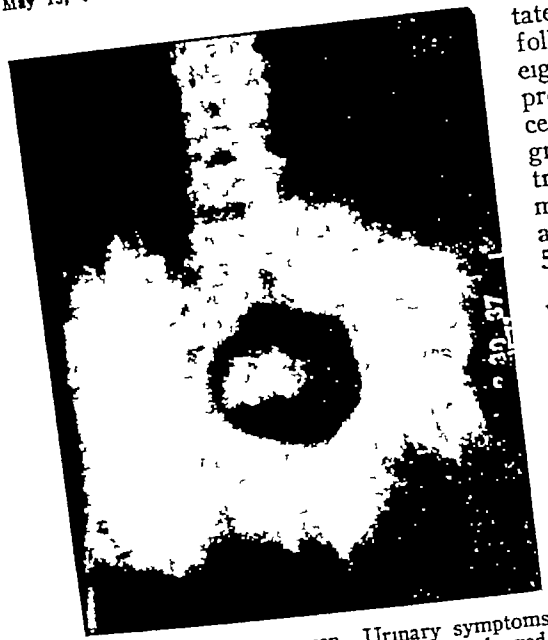

Fig 14 Age sixty-seven, Urinary symptoms for eight months, rectal, moderately enlarged, irregular, stony hard, fixed in position, catheter passes with difficulty releasing six ounces residual urine, note elongated, narrow, irregular posterior urethra with small filling defect at bladder neck. *Carcinoma of Prostate*

preferably treated by transurethral resection [14] However, the functional results from this procedure are not always satisfactory in these cases It is our experience that a certain amount of temporary incontinence is just as frequent in these cases than in transurethral resection for prostatic adenoma This may be explained by the fact that these lesions are intimately attached to the internal vesical sphincter and the trigonal muscle, and when the pathological tissue is removed these muscles are necessarily partially removed with the obstructing tissue. Extreme care must be used to prevent the removal of too much tissue at the vesical orifice in these cases

To properly care for the various types of prostatic enlargement, a urologist should train himself to be capable of doing suprapubic and perineal prostatectomies as well as transurethral resections Both perineal prostatectomy and prostatic resection are fraught with greater possibilities of complications than the suprapubic operation and if one has not had the training or the temperament to do these operations, he will do much better to continue with suprapubic prostatectomies Nevertheless, if this plan is followed there will be more than thirty-eight per cent (Randall's specimens) of prostatic obstructions which will not receive the best form of surgery In this group are included simple bilateral intraurethral hypertrophy, ten per cent, median bars, eighteen per cent, prostatic abscess, five per cent, and carcinoma, 5 5 per cent

For one who has had the training and has the temperament, transurethral prostatic resection is the treatment of choice for many prostatic enlargements It has been amply proved that many complications are possible with such a delicate operation, but it has also been shown that as experience increases, complications decrease The low mortality, morbidity, and short hospitalization reported by Bumpus,[5] Alcock,[2] Thompson, Nesbitt,[21] and others, depends primarily upon the operators skill and the postoperative care Nesbitt believes that postoperative symptoms of frequency, burning, and pyuria are the result of the introduction of infection during or after the operation, or that a portion of devitalized prostatic issue remains as an irritating focus in the prostatic urethra He advocates as

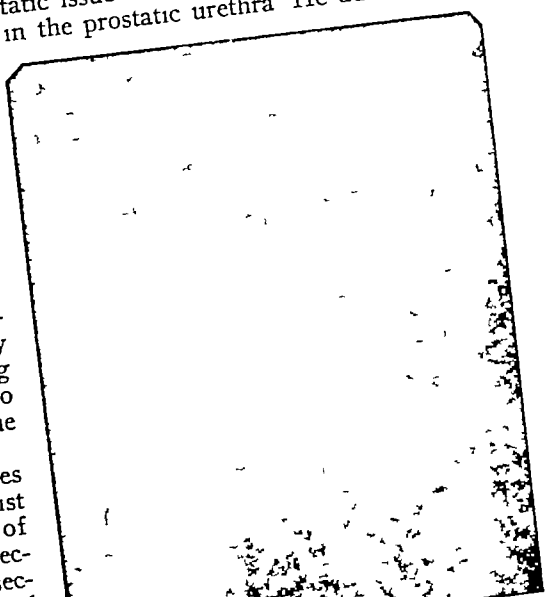

Fig 15 Age fifty-five, Urethrogram following transurethral resection for moderate lateral and posterior commissural hypertrophy Normal bladder outlet yet bladder neck is somewhat enlarged.

complete removal of the prostatic hypertrophy by resection as possible

Only about one-tenth the number of patients require preoperative preparation for resection compared to those requiring preparation for enucleation of the prostate, according to Bumpus [5] Cabot [7] has shown that prolonged urethral catheter drainage changes a dormant prostatic infection into an acute infection which involves the urethra, prostate, bladder, and kidneys Probably the removal of the prostatic obstruction by resection establishes adequate drainage at once and the improvement formerly noted preparatory to surgery is accomplished during the convalescence from resection The mortality reported from cystotomy for drainage alone, occasionally exceeding ten per cent, may be avoided by resection [1] I do not wish to minimize the necessity for preliminary preparation of a certain group of patients with considerable urinary retention and especially with an elevated blood urea nitrogen or nonprotein nitrogen However, it is not uncommon to see a patient's urinary output diminish and his blood urea become elevated during either prolonged drainage from a retention catheter or following a cystotomy for drainage

Recurrences of obstruction following prostatic enucleation have been reported by Young,[30] Lewis,[15] Chute,[8] Illyes, and others There have been reported some recurrent obstructions following resection It is probable that a patient would prefer a repetition of a resection with a relatively short hospital stay than an "open operation"

It would indeed be fortunate if the horror of prostatic enlargement could be expelled from the minds of men in advancing years If they realized that early diagnosis and treatment would require a short hospital stay with no outward or visible evidence of their operation, many would seek advice early The insidious yet permanent damage to the kidneys and cardiovascular system could be prevented

When we are fortunate enough to discover an early carcinoma of the prostate, a radical total perineal prostatectomy, as described by Young,[31] offers the only chance of cure Barringer[3] has stated that prostatic carcinoma for the most part is a fatal disease and this view is almost universally held by those who treat this disease by any palliative means Fully realizing the seriousness of this disease, I believe we are justified in resorting to radical surgery in early cases Randall's series of cases revealed only 5 5 per cent of prostatic carcinoma, but Moore[20] found 16 7 per cent in 375 routine prostates examined Moore also found more than one origin of carcinoma in the same prostate in eleven out of fifty-two cases, yet only four of these fifty-two showed microscopic evidence of invasion outside the prostate Of Moore's cases 73 5 per cent arose in the posterior lobe, 8 8 per cent in the lateral lobes, and 14 8 per cent from the anterior lobe He concludes that metastases and invasion outside the organ is a late manifestation of the disease

Rich[28] found carcinoma in fourteen per cent of 292 prostates in a routine examination of prostates in men over fifty years of age and found most of them situated either laterally or posteriorly near the capsule of the gland In these cases 65 8 per cent were not recognized clinically Caulk and Alcock[1] each found cancer in nineteen per cent of routine surgical prostates, and Young[30] found carcinoma in twenty per cent of obstructive prostates Although early carcinoma of the prostate is essentially a silent disease, since its origin is usually in the posterior lobe which is palpable by rectum, a suspicious nodule felt during routine rectal examination may lead to an early diagnosis

Although early diagnosis of prostatic carcinoma is difficult and often impossible, we should constantly be aware of the frequency with which it occurs and offer early surgery as the only hope of cure Smith,[26] Rolnick,[24] Young,[31] Lowsley, and others have reported successful radical perineal prostatectomies and believe that since other forms of treatment at present offer only palliative relief, the patient is entitled to an opportunity for cure Extension usually first is discovered around the seminal vesicles and frequently can be determined by palpation

When metastases have occurred, prostatic resection for urinary obstruction, radium implanted into the prostate,

and deep x-ray therapy for pain, are valuable adjuncts in relieving the patient

Before any operation is undertaken it is essential to obtain all possible information concerning the type and extent of the obstructing lesion We have found cystourethrograms distinct aids in deciding what surgery should be undertaken When used in conjunction with the other diagnostic information, one can better visualize the pathological process and hence institute proper surgery

Summary

1 Proper diagnosis of the type, location, extent, and character of the obstructing prostate is essential before surgery is instituted

2 Aerograms and cystourethrograms in the semi-lateral position obtaining a contrast between the air in the bladder and an opaque jelly in the prostatic urethra are diagnostic of the prostatic obstruction in most cases, and are a distinct aid in determining the extent, character, and location of the obstructing tissue

3 The lateral spread and increased length of the prostatic urethra is caused by lateral lobe intrusion, an anterior angulation at the bladder neck may be noted by the curve in the catheter in the aerogram or by the opaque jelly in the aerogram and is significant of various changes occurring on the floor of the vesical outlet, stereoscopic x-rays permit one to visualize and differentiate each prostatic lobe protruding into the bladder, some enlargement of the prostate by rectal examination combined with a narrow, irregular, and elongated urethra is very suggestive of prostatic carcinoma

4 Rectal examination reveals little or no enlargement in fifty per cent of patients with prostatic obstructions (From Randall's pathological specimens)

5 Prostatic resection is the procedure of choice in many prostatic obstructions, providing the operator is sufficiently skilled in the technic and postoperative care

6 Radical perineal prostatectomy offers the only hope of cure in early carcinoma of the prostate

7 For those who do not do prostatic resection, perineal is preferable to suprapubic prostatectomy in bilateral intraurethral (extravesical) enlargements and from an anatomical study should give better functional results

8 Suprapubic prostatectomy should be done in those cases which require a preliminary cystotomy for drainage, by the surgeon who occasionally operates upon the prostate and by those urologists who have not become sufficiently familiar with the technic of prostatic resections and perineal prostatectomy

9 Aerograms and cystourethrograms are presented which show the characteristic prostatic enlargements with the realization that various combinations of these lesions are often present in the same patient

SKELETAL SYSTEM MANIFESTATIONS DURING SECONDARY SYPHILIS

BEN A NEWMAN, M D and HARRY C SAUNDERS, M D, *New York City*

From the Department of Dermatology and Syphilology, New York University College of Medicine, and Bellevue Hospital, Services of Drs Howard Fox and E R Maloney

That syphilis may cause the most bizarre clinical pictures is knowledge so common that the metaphor "Syphilis, the great imitator" has become a trite expression However, certain syndromes occur so infrequently that recognition of their syphilitic nature comes about by chance or only after the late appearance of some pathognomonic clinical sign The unusual features in the case herein described warrant its report and serve as a basis for discussing syphilitic manifestations in the supporting structures of the body during the secondary stage of the infection

Case Report

C T, a married white woman, aged twenty-eight, with two normal children, was admitted to Bellevue Hospital on March 2, 1936 Her present illness began ten weeks previously with loss of weight, malaise, sore throat, and fever On January 9, 1936, she entered an ear, nose and throat hospital She remained there for five weeks, with a temperature of 101 to 102°F, and her symptoms increased in severity Her blood count was reported as normal, Roentgenograms of the chest were normal, and two Wassermann tests were anticomplementary About three weeks after her admission to this hospital a rash appeared on her face and shoulders She left the hospital of her own accord, unimproved, on February 12, with a diagnosis of "Chronic Sinusitis, Acute Infection of the Tonsils, Ulceration of the Left Anterior Pillar, Possible Bronchial Pneumonia" At home her symptoms progressed and finally she was admitted to Bellevue Hospital, suffering from excruciating pains in all the limbs, severe hyperesthesia, numbness and tingling in the feet and hands, and inability to move her legs and arms

Examination revealed a thin, emaciated, acutely ill woman, unable to move any of her limbs or raise her head. Her weight was sixty-seven lbs Her skin was dry and inelastic There was an eruption on her face and left shoulder, located primarily on the cheeks and chin The eruption consisted of about a dozen pea to nickel-sized, discrete, dull red papules The ears and nose were normal Examination of the eyes revealed normal movements of the eyeball and normal fundi The pupils were round and equal and reacted to light and accommodation The posterior pharynx and anterior pillars were injected In the center of the posterior portion of the tongue was a shallow, dime-sized ulcer, surrounded by a zone of erythema and only slightly tender on palpation The ulcer was covered by a greyish, nonadherent, necrotic exudate and had an infiltrated base. The gums were spongy and the submaxillary and anterior cervical glands were considerably enlarged The heart was not enlarged, the sounds were normal, and the rate was 112 per minute. Physical examination of the lungs was normal The abdominal viscera were not palpable nor tender and the pelvic examination revealed no abnormalities other than a slight leukorrhea There was a generalized lymphadenopathy

The skin of the lower extremities was markedly hyperesthetic and there was exquisite tenderness to slight pressure over all the long bones, joints, and muscles The muscular atrophy was striking, the limbs giving the appearance that no soft tissue other than the skin covered the bones There was a bilateral foot drop and only the faintest motion of the fingers could be elicited A provisional diagnosis was made of "Post-infectious Peripheral Neuritis" or "Avitaminosis with Peripheral Neuritis" The patient was placed on a high vitamin diet with ascorbic acid parenterally

The neurologist found all the deep reflexes present and active, no ankle clonus nor Babinski, absent abdominal reflexes, and an intact vibratory sense. He expressed the opinion that the marked generalized muscular atrophy and weakness was of constitutional origin and not a result of a neuritis

After five days of vitamin therapy the

We wish to thank Dr Lewis J Friedman, Director of the Roentgenological Service of Bellevue Hospital, for his many helpful suggestions

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

patient's symptoms were more aggravated A routine Wassermann test gave a four plus reaction and the patient was referred to the service of Dermatology and Syphilology On the basis of the cutaneous and mucous membrane lesions, a diagnosis of secondary syphilis was made.

On March 2, the blood count was Red blood cells, 3,650,000 Hb, sixty per cent. White blood cells, 23,000 The differential count was PMN, forty-one per cent. Meta II, thirty-five per cent, Meta III, two per cent, Lymph, twenty per cent, Eosin, one per cent, Baso, one per cent.

The urine examination was normal and tests for Bence-Jones protein were negative The blood serum calcium content was 14 1 Mg per cent and the phosphorous content was 4.2 Mg per cent. Repeated blood cultures revealed no growth X-ray examination, as reported by Dr L J Friedman, showed multiple areas of bony destruction involving the outer table of the frontal bone of the skull, the corticalis of the right radius, both ulnas, the neck of the left humerus, and both tibias These lesions were purely osteolytic, with no evidence of thickening or periosteal reaction Some of the lesions resembled a metastatic malignancy of tuberculosis (Fig 1)

A subsequent history was obtained from the husband, who, having been estranged from the patient, returned to her only a few weeks before the onset of her illness They had had a single coitus, the first week in December, three weeks before the onset of her illness The husband stated that he developed a penile lesion in November, which he had left untreated. A Wassermann test performed on him was reported four plus The children's Wassermann reports were negative.

Antisyphilitic therapy was started March 7, with two c c sodium bismuth tartrate, intraglutially, every three days for five injections One week after the first injection the patient was able to sit up in bed and move her hands and legs freely, pain and tenderness having greatly diminished After two weeks, neoarsphenamine was started with an initial dose of 0 3 Gm. and maintained at 0 45 Gm. up to the time of discharge Two months after admission the patient had received 4 2 Gm of neoarsphenamine and ten c.c. of water soluble sodium bismuth tartrate and one Gm of bismuth as bismuth salicylate suspended in oil

At the time of discharge her general condition was excellent. She had gained thirty lbs in weight, recovered complete use of all her muscles, pains had entirely disappeared, blood count was normal, and Roentgenograms of the bones showed all the osteolytic areas to be less prominent than previously, with complete healing of some of the smaller lesions The patient was given continuous antisyphilitic therapy in the outpatient department and has remained in excellent health Another Roentgenogram two months later showed complete healing with no evidence of any bone lesions (Fig 2 and 3) Unfortunately, a spinal fluid examination and punch biopsy of the bone were not obtained At no time could we get permission for either procedure

Discussion of Case

This case presented a secondary syphilide of the face and mouth, and a severe myopathia with marked wasting of all the voluntary muscles, associated with widespread destructive bone lesions Modern texts make little or no mention of the myopathies of secondary syphilis, but it is interesting to note that this syndrome regularly appeared in the writings of the syphilologists of the past century However, the destructive bone lesions as described herein have never been considered as manifestations of early syphilis But the widespread appearance of these bone lesions, their lack of resemblance to any known disease (except tuberculosis or yaws), their occurrence during a toxic phase of early cutaneous syphilis, and their prompt response to antisyphilitic therapy, dispel all doubt that this bone destruction was of syphilitic origin

During the past year two cases have been reported that bear upon this type of bone lesion—Tauber and Goldman[1] reported a case of "Syphilitic Anemia with diffuse Osteitis" Their patient had a penile lesion with satellite bubo, from which Spirochete pallida was found on dark-field examination He had a generalized skin eruption, a severe macrocytic anemia and "areas of bone destruction of varying diameter in the skull, in the upper third of the left tibia, and in the left clavicle and scapula. There was very little thickening about these areas and very little periosteal reaction They resembled multiple myeloma" There was a complete response to antisyphilitic therapy The authors stated "if one attempts to classify these various manifestations as syphilitic, one must suppose that the bone involvement and anemia are late reactions, and the acute penile lesion a super infection"

Mandelbaum and Saperstein[2] reported a case of "acute gummatous osteomyelitis" in a case of transfusion syphilis Their patient, a woman of twenty-eight years, was transfused after being delivered of normal twins Eight weeks later she developed severe pains in the bones followed by the development of subcutaneous nodules at these painful sites She was found to have a four plus Wassermann reaction and Roentgen-ray examination showed several "irregular areas of rarefaction in the sternum and skull" At no time had there been lesions of the skin or mucous membranes Roentgenograms made several months after antisyphilitic therapy showed complete healing Examination of the husband and the two children showed no evidence of syphilitic infection but the donor, the patient's brother, was found to have a four plus Wassermann reaction The authors then conclude "this patient thus represents a case in which acute gummatous osteomyelitis was the initial lesion of syphilis transmitted by a blood transfusion" In view of this osteolytic bone lesion (which is not unlike that of the two cases cited above), appearing less than two months after the initial inoculation, we believe that this case should be more popularly described as a rarefying osteitis of early syphilis and classified as a syphilitic osteoperiostitis

Wile and Senear[3] reported a series of sixty cases of secondary syphilis with involvement of the bones and joints Unfortunately their report did not include Roentgen-ray studies, but was based upon symptomatic and objective evidence of skeletal changes Of their sixty cases they reported that in eighteen the general health was severely affected, and in these the patients had anemia, loss of weight and debility, and there was no relationship to skin or central nervous system involvement

This latter evidence of syphilitic toxemia appears to be a common factor in all the cases manifesting lesions of bones during the secondary stages of the infection This debility is also an accompaniment of osseous syphilis of the newborn in which destructive bone lesions are a common occurrence (Fig 4) On this evidence one cannot help but feel that

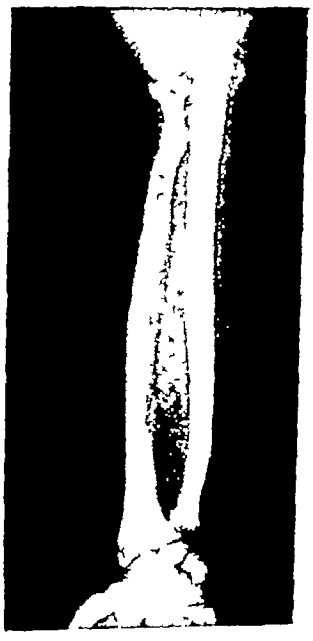

Fig 1 Osteolytic lesions of secondary syphilis Multiple areas of bone destruction involving corticalis of right radius and ulna

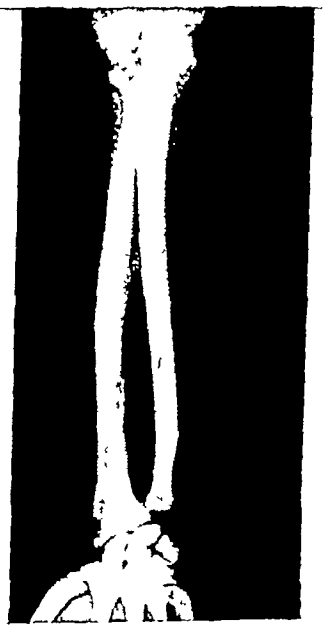

Fig 2 Right radius and ulna three weeks after initiation of antisyphilitic therapy Beginning healing of lesions

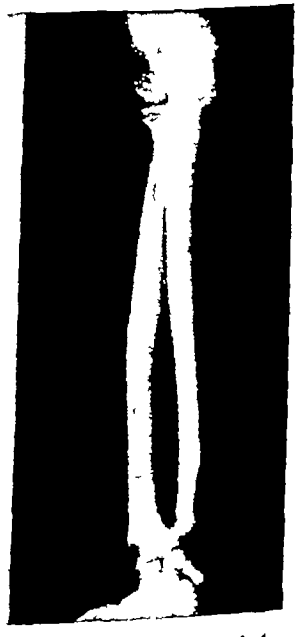

Fig 3 Right radius and ulna four months after initiation of antisyphilitic therapy Lesions completely healed

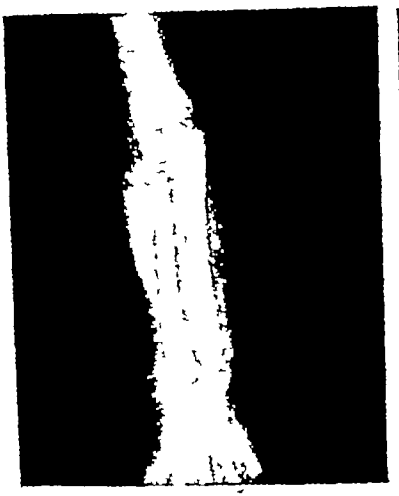

Fig 4 Osseous syphilis of the newborn Note destructive areas of radius, ulna, and distal end of humerus In addition, this demonstrates other features of osseous syphilis of the newborn—periostitis, submetaphyseal rarefaction, and widening of provisional zone of calcification

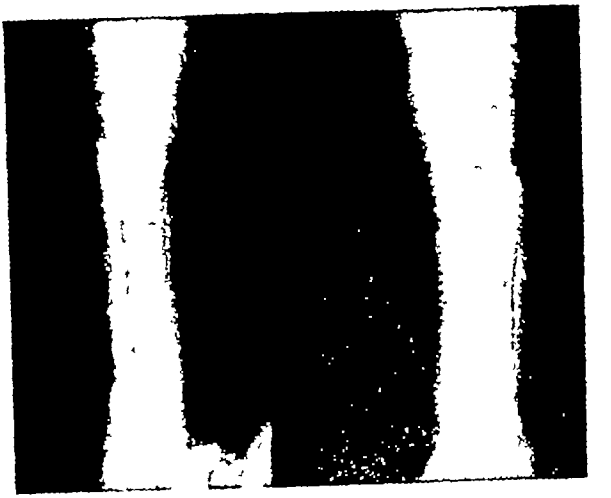

Fig 5 Osseous syphilis of the newborn Serration of distal ends of femurs, destruction of proximal ends of tibiae, with epiphyseal separation and impaction, and medial displacement. Note symmetry of these lesions

Roentgen-ray studies of the bones should be made in those patients with signs of toxemia, during the early stages of their infection

Early Syphilitic Involvement of the Skeletal System

Muscles In early syphilis, a myositis not infrequently causes a diffuse, aching pain This occurs just before the appearance of the rash and is characterized by being more severe at night and by being localized chiefly in the flexor muscles and in the erector spinae muscles of the back Many years ago Fournier described two types of muscular involvement during early syphilis, a progressive weakening of the muscular power with intermittent trembling, and a progressive wasting of the muscles It is noteworthy that this latter manifestation, which is a prominent feature in our case report above, does not appear in the literature of the past few decades

Late syphilitic involvement of the muscular system is not uncommon and has been observed by most syphilologists The inflammation may be of three types (1) a generalized infiltration of the muscular tissue, (2) localized gummata, or (3) a combination of the two When the inflammation is in the form of a localized gummata, the individual swellings are the prominent symptoms, but when, as is more common, the combination of diffuse myositis and gummata exists, the muscles become increased in size, firm and resistant to the touch The swellings may increase in size until entire muscular groups are involved and after a time, become adherent to the surrounding tissue, interfering with their function Some gummata may soften and break through the skin, producing the typical gummatous ulcer This same type of gummatous involvement of the muscle may also appear as a late manifestation of congenital syphilis, between the fifth and twentieth years

The prognosis in all these types is excellent

Tendons and tendon sheaths The tendons, being avascular structures, are rarely involved alone The tendon sheaths may be affected separately, but eventually both are involved Tenosynovitis may occur during secondary syphilis as a simple serous inflammation with effusion which, after a period, may lead to adhesions The swelling appears rapidly, is painless, and does not materially affect the movements of the adjacent joints These have been most frequently observed in the tendon sheaths at the back of the wrist, the ankle, hamstrings, and biceps This condition must be distinguished from

tuberculosis and often a therapeutic test is necessary to confirm the diagnosis

Gummatous tenosynovitis, which should be more accurately named a perisynovitis, is a more common occurrence than the secondary form and is usually found in debilitated patients It may begin as a solitary mass or as multiple small nodules, fusing to form an irregular tumor and adhering to the skin The mass may then soften, ulcerate, and break through the skin, presenting the usual tertiary syphilitic ulcer with the typical serpiginous border

Bursae Occasionally there occurs a generalized toxemia in secondary syphilis, which leads to serous effusions distributed through the body The bursae are often involved during this process Fournier applied the name "Syphilitic Pseudorheumatism" to the process, because the patient is generally treated with salicylates The swelling and tenderness of the bursae is transient and disappears spontaneously

A gummatous inflammation may appear as an early or late tertiary manifestation, usually in patients who show other evidence of the disease The lesion begins with a sharply defined, painless, sluggish swelling, which later becomes very hard and tense and may reach to an enormous mass It may remain in this form indefinitely or the tumor may soften and ulcerate Any bursa may be affected The affection is usually symmetrical and usually involves those bursae most exposed to trauma The name "Syphilitic Bursapathy of Verneuil," after one of the first to describe this process, has been applied to this gummatous infilteration The response to therapy is excellent

Joints Involvement of the joints in early syphilis is manifested as an arthralgia or synovitis, which may be of an intermittent or chronic nature.

Arthralgia The larger joints are most frequently attacked The patient complains of nocturnal pains in several joints, with no evidence of inflammatory signs such as redness, swelling, heat, tenderness or limitation of motion This may take place very early in the disease, even preceding the secondary rash

Synovitis Intermittent synovitis occurs as a rapid effusion of fluid into one of the larger joints and accompanied by moderate pain, which is more severe at night. Here also there are no signs of inflammation. There may be multiple joint involvement or a progressive involvement, the swelling disappearing from the joint as rapidly as it appears in another But confusion with rheumatic fever should never arise because of the absence of inflammatory signs in the joint and because intermittent synovitis is always associated with other signs of secondary syphilis The prognosis is excellent and the lesions disappear rapidly under therapy

Chronic synovitis, however, is an entirely painless process and it is only after long duration of the asymptomatic swelling that the patient seeks the advice of the physician. It is usually a late secondary manifestation, and occurs most frequently in women It is symmetrical and the knees are most frequently involved There is a marked effusion but there are no inflammatory signs nor any limitation of motion nor impairment of function. The course is chronic and the prognosis is not as good as in the intermittent form Under antisyphilitic therapy the improvement may only be partial and orthopedic care will be required to prevent the deformities and ankylosis

Bones Bone syphilis has been classified as follows

Osteocopic pains	Osteitis
Periostitis	Epiphsitis
Osteoperiostitis	Osteochondritis

Gummatous osteomyelitis

Although this classification is convenient for clinical and roentgenologic descriptions, one must bear in mind that the type of lesions so specified are not static but are various clinical manifestations of different stages of the syphilitic process The literature and most teaching of syphilis have arbitrarily divided the above classification into early and late syphilis, the periostitis and osteocopic pains being considered as manifestation of secondary syphilis and the remainder, as well as periostitis, as manifestations of tertiary syphilis But if one remembers that the bone changes in the syphilitic newborn are usually in the nature of secondary syphilis and that these changes may include any one or all of the lesions listed above, then one must appreciate the futility of such an arbitrary classification This is further borne out by the cases cited herein, of destructive bone lesions in acquired secondary syphilis, hitherto referred to as gummatous osteitis It would be better to regard this as a severe toxic spirochetal infection, for in

both the congenital and acquired manifestations the patient is very ill.

All evidence points to the initial syphilitic bone lesion arising in the medulla and spreading by way of the Haversian canals to the cortex and periosteum This is truly a syphilitic osteomyelitis, the extent of the process depending upon the virulence of the organism and the resistance and age of the patient More than fifty per cent of patients with congenital syphilis (according to some authors up to one hundred per cent) will show osseous lesions at some stage of the disease and the Spirocheta pallida can usually be demonstrated in the medullary canal of every syphilitic fetus The syphilitic osteomyelitis may be diffuse or circumscribed and may be evidenced by any of the pathologic responses to bone infection —periosteal or cortical bone proliferation and destruction, sclerosis, sequestration, epiphyseal separation or pathologic fracture

Roentgenologically, two types of pathologic alteration are distinguished—bone production and bone destruction The earliest changes are usually production, which is later accompanied by, or replaced by, bone destruction Some Roentgenologic pictures are characteristic of syphilis, of which may be mentioned the worm-eaten areas of the outer table of the skull, the periosteal and cortical thickening of the anterior tibia, and the osteochondritis of the newborn However, in more than fifty per cent of acquired bone syphilis, the diagnosis can be made without the aid of the clinical picture (Pyogenic osteomyelitis, yaws, and occasionally tuberculous osteomyelitis may present similar roentgenographic changes)

Bone Lesions of Early Congenital syphilis (The first year) The osseous lesions appear during intrauterine life or soon after birth, usually within the first six months The primary lesion is at the end of the shaft, adjacent to the epiphyseal line hence it is described as an osteochondritis or epiphysitis The lesion is a diffuse infiltration in the bone-marrow, with fatty degeneration and necrosis of their cells and the blood vessels, which produces a yellowish color The most common sites are at the ends of the long bones The granulation tissue extends from the medulla and infiltration into the epiphyseal cartilage, replacing both the calcified and noncalcified cartilage matrix Tongue-like projections of granulation tissue, accompanied by blood vessels, extend between the cartilage columns, distending their orderly arrangement and transforming the narrow, straight, gray line of the epiphysis into a thickened, irregular, yellowish-white band The effect of this inflammatory process on the epiphysis is to produce an increased but irregular activity of growth The Roentgen ray appearance, while characteristic, does not show the full extent of the pathologic process as the epiphysis are not yet calcified at this age

Clinically, the most common symptom is pain and loss of function, the infant having the appearance of being paralyzed Examination shows a slight swelling around the joint and tenderness, but no true paralysis, hence the name pseudoparalysis has been applied

On roentgen ray examination this appears as a serration or irregularity of the epiphyseal line on the cartilaginous side, with a widening of the provisional zone of calcification and submetaphyseal rarefaction Accompanying this picture may be a circumscribed or diffuse osteomyelitis, appearing as punched-out areas of cortical necrosis, or the cortex of the shaft may show periosteal proliferation and thickening The bilateral appearance and symmetry of these lesions are the characteristic features, and epiphyseal separation and dislocation are not infrequent occurrences (Fig 5)

Bone lesions in acquired early syphilis or delayed congenital syphilis As the bones become more calcified and more mature, the epiphyses become more resistant to infection and hence the lesions will usually be found in the shaft of the long bones The lesion may be localized to one portion of the bone, it may be diffuse, or several bones may be involved The most common, earliest lesions are those of periosteal inflammation The outer layer of the cortex acquires a fuzziness because of the periosteal reaction, in which new bone is deposited to form a thickening of the shaft,

When the disease is of long-standing, the new bone can completely fill the medullary cavity and there may be fuzzy, radiating trabeculae along the periosteal

surface There may be destructive lesions along the outer surface of the cortex with extension through to the medullary cavity, producing a picture of irregular areas of decreased density in a field of increased density from periosteal new bone formation In late syphilis any type or combination of the above mentioned lesions may occur We do not wish to enter into a detailed discussion of these later lesions, except to point out that on occasion they may occur as a manifestation of early syphilis

Summary and Comment

We have reported a case of early syphilis with severe myopathia and osteolytic bone lesions, as manifestations of a severe syphilitic toxemia Two cases with similar bone lesions have been cited as appearing in the literature

We have given a brief review of early syphilitic involvement of the entire skeletal system

In this discussion of early skeletal syphilis, we have attempted to demonstrate that syphilis may be responsible not only for unusual, divers syndromes, but also for multiform lesions appearing most capriciously, without regard for time or place

Discussion

DR. RICHARD L SAUNDERS, *Buffalo*—May I congratulate the authors for an able presentation of a case of early bone syphilis This patient was extremely ill with an apparent low resistance factor Unless the diagnosis had been made or the miracle had happened with the mobilization of her resistance mechanism, she would have probably died of secondary syphilis

Bone destruction in early syphilis is unusual The presence of the spirochete in the bone-marrow is probably not Neisser found them as early as a few hours after the initial entrance of the organism Destruction of well-calcified bone requires time The Spirochete in the early case is content to flow down the Haversian canals to the periosteum, where it creates the usual bone manifestation of early syphilis, a periostitis This is characterized by local areas of tenderness and perhaps some slight swelling The x-ray picture at this stage usually reveals nothing Another symptom related to the skeletal structures in early syphilis which has been mentioned, is bone pain Stokes states that secondary syphilis headache belongs under this heading There is no pathological basis for this pain

The second unusual feature of this case was the muscle atrophy I think that most of us have seen early cases complaining of muscle pain, but I know that I have never seen muscle atrophy The same I think is true of the joints Arthralgia is occasionally elicited as part of general aching pains of early syphilis, but bursitis or synovitis must be extremely rare.

I think that the authors have proven beyond doubt that although bone destruction is extremely rare in early syphilis, it did occur in this case The eruption, mucous membrane lesion, generalized adenopathy and positive blood, clinched the diagnosis of secondary syphilis The fact that these bone lesions occurred during this phase of the disease and responded to its therapy, proves beyond doubt that these bones were syphilitic

The authors have drawn a parallel of their case to that of bone involvement of the newborn, where destructive bone lesions are not infrequent I believe that they have every right to do this They are both caused by mass invasion of Spirochetes in the same structure.

The reason, however, that destruction of the skeletal system is more frequent in the newborn is that these structures have less resistance than mature bones I do not think that it can be explained on the fact that adult bones are better calcified, although this might have something to do with their immunity It is true that the bulk of the bone pathology of newborn syphilitics centers around the diaphyseal-epiphyseal junction where calcification is not complete

The authors have also shown that the usual teaching that periostitis is the lesion of early syphilis and that osteitis, osteomyelitis, osteochondritis, etc., are late syphilitic lesions, by bringing out the fact that all of these so-called late manifestations occur in

early congenital syphilis, which is really a spirochetemia, the same as secondary syphilis I feel however, that for purposes of teaching that congenital syphilis should be kept separated from acquired syphilis and that this arbitrary classification should stand

DR. DAVID BLOOM, *New York City*—In connection with the most interesting case reported by the authors I wish to mention a case which I have presented before the Section of Dermatology and Syphilology of the New York Academy of Medicine (*Arch Dermat & Syph*, 29 940, 1934)

It was the case of a colored girl, aged twenty, who came to Bellevue Hospital with a generalized, rather profuse eruption diagnosed as miliary papular syphilid and confirmed by a strongly positive Wassermann reaction of the blood The exact time of the exposure could not be ascertained Following two injections of a bismuth compound and one of neoarsphenamine the patient complained of pain in the left acromioclavicular joint, over which there were seen an almond-sized, moderately firm swelling, erythematous, tender to pressure and painful on motion of the arm She complained of spontaneous pain in the left shoulder which was most pronounced at night A roentgenogram revealed "destruction" of the acromial end of the clavicle On further antisyphilitic treatment, after four injections of neoarsphenamine and five of a bismuth compound, a second roentgenogram was taken which showed distinct regeneration of the bone After several more injections the patient was discharged from the hospital and referred to the dermatologic clinic The patient soon discontinued attendance at the clinic but returned two months later with a right facial paralysis Following further antisyphilitic treatment the facial paralysis improved rapidly A roentgenogram of the acromioclavicular joint taken at that time (about 3½ months following the appearance of the bone lesion) showed "progressive regeneration of the acromioclavicular end of the clavicle," and the roentgenogram taken one month later reported as showing "an arrested pathologic process" The combination of bone destruction with nerve involvement in the early secondary stage in spite of antisyphilitic therapy would indicate possibly a low immunity of the patient towards the Spirochete

I believe that if syphilitic patients were observed closely and roentgenograms taken of clinically affected bones there would be found destruction of the bone in secondary syphilis more frequently than it is believed at the present

Transference of tissue from one human being to another is now conceded to be a worthless procedure in most instances, regardless of blood matching, says *Colorado Medicine* Two exceptions have been found advantageous cartilage as an homogenous (from another individual) graft, and the use of skin from an identical twin Instances in which an identical twin is available when needed as a skin donor are rare indeed In the former, cartilage is usually taken directly from the right costochondral junction of the donor or from a bed of cartilage hoarded beneath the skin of his abdominal wall at a previous operation Cartilage preserved in some antiseptic solution such as alcohol, merthiolate, or boric acid and refrigerated may keep for many months There are, however, limitations to homogenous cartilage grafting If the perichondrium is left on, the graft is more apt to twist or curl, and if it is removed the cartilage is in greater danger of absorption than when it is autogenous (from the patient himself) In cases with extensive denudation of the body surface—wherein there is no available autogenous skin, or the shock of cutting it would aggregate the dangerous situation—life may be saved by temporary "taking" of homogenous grafts

---

Housewife Did you kill all the germs in the baby's milk?

Maid I hope so, I put it through the meat-chopper twice.—*Boy's Life*

"I believe," declared the Irishman, "that me youngest son is born to be a surgeon"

"Phwat leads you to say that?" inquired the hod-carrier

"Oi caught him usin' th' scissors on a book Oi'd lately bought, and before Oi could stop him he cut out the appendix"—*Nebr State Med Jour*

It is alleged, remarks the *AMA Journal*, that a considerable amount of money now available for malaria, through various governmental sources, is being spent for the elimination of mosquitoes in areas where there is no malaria

THE SCOPE AND FORM OF LOCAL OFFICIAL HEALTH SERVICES

With Particular Reference to the City of New York

HAVEN EMERSON, M D, *New York City*

Agreement on definitions gives the best prospect of rational discussion and an intelligent conclusion on almost any topic

Official public health services are properly described as those applications of preventive medicine which are authorized by law as a function of government for social ends Not theory of public health but its practice, not curative but preventive medicine, not voluntary or unofficial but governmental agencies, services not for the individual but for the community

By community we mean any political unit within a state which is required or authorized to maintain a department of civil government for the purpose of protecting its health whether this be urban or rural, a city, a county, or a district embracing city and county or parts or all of one or more counties

It is well to keep in mind the organic structure of health administration created in the past hundred years out of almost nothing, into the most altruistic, and almost complete in scope and range of human application, among the functions of modern society I am aware that there were water conduits in Minoan Crete, and sewers in Rome, and quarantine in Venice of the Doges, but public health in the modern social sense began in England in 1842 From the international agencies concerned with health, by treaty, volunteer cooperation or mutual self-interest, through the federal or national health ministries or services of the respective central governments, down through the departmental, provincial, and state health service to the ultimate responsible unit of city, county, town, village or district, there is not only a remarkable similarity of object and function but a high degree of uniformity in method and accomplishment of official health services all over the world

It may be considered a truism of public health practice that the smaller the population unit capable of supporting a full-time staff of competent and professionally trained health workers, including at least a physician as health officer, the public health nurse, the sanitary inspector, and the statistical clerk or secretary, the more intimate, responsive to local needs and effective will be the character of public health work

Also it must be taken for granted that the lower the economic level of any population group the larger it must be, or the heavier its per capita tax, to support a minimum essential staff of competent persons, and the more likely it will need financial assistance from the state or national government in grants of money or personnel for its health services

Further to clarify the meaning of the term "preventive medicine" as employed by government for social ends, let me say that the more public health services are distinguished and kept apart from public care of the sick, the better will be the quality of the health services of the community

Let us understand that within the ample and beneficent tabernacle of the medical sciences there are the practices of individual and administrative medicine and both of these are employed for both treatment of the sick, so-called curative medicine, personal or organized care of the sick, and prevention of disease, or so-called preventive medicine, *i e*, personal and public health We are for the moment concerned only with administrative medicine, and with that aspect of medical administration which under the authority of laws and with the resources of appropriated tax money, attempts to raise the level of the health of the people of a given local political unit, largely though not exclusively, by prevention of disease, so that more of those born alive shall survive and achieve such quality

Read before the New York County Medical Society, February 28, 1938

and duration of life as their inherited qualities and personal conduct permit

May I call your attention to a significant omission from the definition I ask you to accept? It is not advisable, in my opinion at least, at the outset of a discussion of public health, to include among the functions of a local health department the care of the sick, with the single proviso that if the prevalent or available care of communicable disease is insufficient in amount or quality to protect the community, and to deal humanely with the sick who must be isolated, then the health officer may properly assume responsibility for treatment of the patient

It is obvious that in rural, economically dependent communities where even the most elementary provision for diagnosis and treatment of disease may be difficult to obtain, it is likely that the health officer will be called upon as the most competent representative of local government to organize such services for the sick as the government can afford, and human need and consideration demand Even in such communities the health officer should make every effort to place the responsibility for care of the sick, except in emergencies, on the practitioners of medicine of the vicinity, subsidized if necessary by public funds I know few health officers of states or cities who are sufficiently experienced in care of the sick to be accepted as leaders in this particular field of medical practice

In cities and most of the more populous rural counties, at least in northeastern United States where there have developed over the generations such institutions and agencies for the sick as seem best to meet the needs of the locality and the standards of good medical care, the functions, scope, personnel, authority, and appropriations for the local health department do not properly include or provide for care of the sick The more health departments intrude on care of the sick in general, the less effective and attentive are they to health, or vice versa The health department may properly set high standards for outpatient or bed care of patients with communicable diseases, and must, if needs be, demonstrate superior diagnostic and treatment procedures to be followed by hospitals, dispensaries, and physicians under other auspices

May we pause a moment further at the word *official,* which implies services derived from government as distinct from those provided by voluntary agencies supported by philanthropy or cooperative effort, and contributions or earnings Under our laws there is almost no limit to the range of activities permitted under voluntary auspices, save only those which involve the right of entry into private premises or the violation of confidential relationship between physician and patient

The less well government serves the people, be it in police or fire protection, in education, health or recreation, in culture and the arts, the more abundant are the expressions of private initiative in an endeavor to supplement the inadequacies of civil government, to initiate new or promising innovations in health services or to demonstrate the possibilities of benefit from expenditures or experiments which a cautious and thrifty or ill-informed government hesitates to incur It must be obvious to those who follow the trends in legislation, and in state and local public health, that there are serious potential hazards to representative government, to social representation, and to the prestige of official health agencies in the dominance by lobbying and by other forms of political influence of large wealthy unofficial agencies in the State and City of New York If the nonofficial agencies and their contributors devoted but a modest fraction of their energies, influence, and funds to making our civil government do a first class job of health protection, and insisted upon economical and efficient use of public funds for this purpose, their operation of auxiliary and often duplicating health services and the costly process of raising money by public appeal, would be largely unnecessary

The prestige and appreciation of official health services would be vastly increased if they alone had the public's attention, and their scope of service were comprehensive and wholly competent

We are not concerned with the functions of non-official or so-called voluntary health agencies, even though by one device or another most of our northern

urban communities are persuaded to pay about two dollars towards the support of non-official health agencies for every dollar of tax money appropriated for official health work A fair index of the adequacy, efficiency, and public confidence in official health services might well be the absence of non-official or quasi-government health services supported by private funds Voluntary health agencies should study, watch, stimulate, and gain public support for, but not conduct essential health services The sums available to the Commissioner of Health of New York City are ample for the highest grade of official municipal health services In addition to the seventy-four cents per capita provided in the regular budget of the City of New York for the Department of Health, there is another sixty-three cents per capita now available for purposes determined by the Commissioner of Health, from federal grants and from foundations and individuals Certainly no necessary health function of government need be neglected where $10,258,000 is available for seven and a half million people who are at the same time provided with more abundant and competent institutions for the care of the sick and for medical care and popular education than can be found among any similar population elsewhere in this country or abroad

Accepting then, if you will please, the definition that local official health services are those which apply the science and art of preventive medicine through government for social ends, let us consider the scope and form of the functions of the local health department They are six in number and hardly need naming to any body of physicians today anywhere on this continent

1 Chronologically, and in modern public health elemental in importance, is the registration of births, deaths, and notifiable diseases

2 Historically is environmental sanitation typified by control over all potable water, disposal of human waste, particularly household sewage, safeguarding perishable foods and particularly milk and dairy products, interest in cleanliness of air, abatement of sanitary nuisances, and prevention of overcrowding in homes, work, travel, and enclosed places of recreation

3 Control of communicable diseases including tuberculosis and the venereal diseases

4 Diagnostic laboratory services, including immunology, biotherapy, analytical tests of water, milk, etc, and research

5 Maternity, infancy, and child hygiene from the prenatal period until the end of the continuation school or high school

6 Health information

At least one other major function which should appear as a separate division of work or be included as a specialized subdivision under Sanitation is Industrial Sanitation and Hygiene, the control of occupational hazards

It *may* be that some knowledge and procedure will develop out of the welter of words and the muddled thinking of the psychiatrists and their would-be colleagues, the psychologists, which will offer a hope of prevention of a part at least of the disturbances of mentality, emotion, personality, and behavior, and that Mental Hygiene in the public health sense, not Child Guidance for problem children, may find a place among the indispensables of public health practice At present mental hygiene is either diagnosis and treatment of the sick or it is a slogan for propaganda lacking precise objectives

A word might be said for local health services in the field of cancer, heart disease, and diabetes, but up to the present time only through analysis of vital statistics and the use of the informational resources of the health department are these matters included among the functions of local public health work

The scope of most of the six usual functions of local health departments depends upon the goal so far reached by the private practitioner of medicine in translating into a self-supporting occupation his personal knowledge of individual preventive medicine The methods used must also vary in proportion to the emphasis required to persuade the public to employ their own physicians for health protection, or the necessity to offer to the public what the average physician either does not know how to do or does not care to undertake

How then can we arrive at the minimum necessary scope and the most effective method of public health services at a cost within the money appropriated?

1 Vital Statistics

There is little room for doubt as to the activities carried on by bureaus or divisions of vital statistics The facts of births and deaths and the incidence of notifiable disease must be recorded, tabulated, analyzed, made available for official use, and published at suitable intervals for public information and record American municipal experience has been from the time of Durgan and Davis in Boston, Snow and Chapin in Providence, and Tracy and Guilfoy in New York that responsible filing, effective analysis, and official interpretation of local vital statistics are of greatest use and interest to the medical profession when done with medical collaboration and guidance It will be noted that since the retirement of Dr Guilfoy as Registrar of Records of the City of New York, there has been no annual publication with analysis and interpretation of the vital statistics of the city There was a descriptive report of the activities of the Department of Health without any tables of mortality, morbidity or natality, for each of the years 1929 and 1930 There was a summary of statistical tables for the years 1930, 1931, and 1932 without interpretation or analysis There is in preparation a summary of statistical tables for 1933-1936, also without textual interpretation Few factors are so influential in encouraging the physicians of a city to concern themselves in progressive reduction of preventable diseases as annual and preferably monthly publication of the significant trends in birth, death, and sick rates In spite of the technical excellence, and vigorous initiative in new and improved methods of registration practice, by the present Registrar of Vital Statistics in New York City, we have a starved and unproductive service, because of lack of personnel capable of analysis interpretation and publication of the facts collected

2 Sanitation

The functions usually assigned to a municipal bureau of sanitation are in the main thoroughly and competently carried out, but there are two serious inadequacies in the protection of the people of New York City against hazards of environment which should be included in the functions of the Department of Health

Both of the functions I refer to have occupied the serious attention of the Health Officers of this city in previous years, first as long ago as 1867-1880, and more recently between 1914 and 1917 Both were discontinued during the immediate postwar decennium of maladministration under Tammany Both should be resumed now and made permanent in the organization of the department of health of each large city in the country I refer to industrial sanitation and the protection of the public health against such harmful and fraudulently promoted products as lead to substantial damage to health by proprietary drugs, foods, and cosmetics exploited by misleading advertising to a gullible and too trusting public

It is not enough that the State Department of Labor should operate an inspectorial service which reaches some of the larger industrial concerns New York City needs at least as effective local interest in the sanitary hazards of its wage earners in all shops and industries, large and small, as has been developed effectively in Detroit and to some extent in San Francisco, St. Louis, Baltimore, and Newark

It is not sufficient for New York City to be told that a good federal food, drugs, and cosmetics law would make a city ordinance confusing and superfluous The people of New York City should be *better* protected than is the nation New Yorkers consume ten per cent of all proprietary and secret formula medicaments sold in the United States

If the New York City Board of Health is released from the request of the Mayor to refrain from action, and the trifling sum needed for enforcement were obtained, an important advance would be made in protection of the health of New Yorkers for which ample authority was provided by action of the Board of Health as much as twenty and more years ago State legislation to the same effect has been unwelcome to the State Department of Health and seems likely to be no more helpful to the people of this city than the pending food and drug bills before Congress

3 Control of Communicable Diseases

The control of communicable disease is a function with which we have been so long familiar that it is only in details that there is question or comment New York City is not yet well-protected against diphtheria in children under school age The medical profession, particularly the pediatricians of the city, are properly chargeable with the responsibility of seeing that every infant brought to their notice for any purpose is actively immunized before it reaches the end of its first year of life It would be a marked advance in policy and practice if New York took a leaf from Detroit's book of experience and enlisted the practitioners in its program, paying them where necessary for immunizations done in a reliable manner in their own offices for children under school age whose parents are not in a position to pay New York City's present program against diphtheria is not entirely adequate to the situation

With regard to tuberculosis and syphilis and gonorrhea, there are elements in the situation beyond the control of the City Department of Health However, beds for the tuberculous will ultimately, though after shockingly long delay, be provided, again a penalty we pay for wastage and neglect by a series of Tammany administrations

With full-time divisional chiefs for the tuberculosis and venereal disease bureaus, the major point upon which success of the present programs may depend is the location and adequacy of the outpatient services for diagnosis and treatment of these diseases The responsible informed opinion of all professional bodies in this city is that outpatient services should be integral parts of hospital services and not be operated independently, apart from the records and staff organization of a general or special hospital Only when all the outpatient services for those diseases are operated on this basis can we expect uniformly high professional standards and attention to all needs of the patients at a level now available in many general hospitals throughout the city The New York City Department of Health should withdraw from the operation of all outpatient services in favor of the Department of Hospitals That this can be done without loss of facilities for the epidemiological and sanitary control of the diseases in question necessary for the Department of Health is quite certain

Not only should the City Health Department withdraw from its present involvement in the practice of medicine in the field of maternity, tuberculosis, and venereal disease in favor of the Department of Hospitals, but in the matter of pneumonia it is obvious from even the brief experience of the past two years that the bulk of the problem, and certainly by far the largest share in the cost and need of specific type diagnosis and therapy will always fall upon the municipal and voluntary hospitals of the city, where if at all the supplementary personnel and services and biological resources of the Department of Health should be available In one borough in 1937 there were 238 patients with lobar pneumonia admitted to the municipal hospital requiring type diagnosis and serum therapy, the hospital laboratory being overwhelmed by the demand for its services, while in the same borough, in the same period, the typing diagnostic station of the Health Department was called upon for diagnosis in but five instances (In the city as a whole, 304 typings)

4 Diagnostic Laboratory Services

If there is any comment upon the scope, quality or quantity of activities of the New York City Bureau of Laboratories, it must be that time, personnel, encouragement, and channels for publication of researches in the biology of disease have been lacking or but insufficiently supplied When one looks back at the great volume of original research with which we were favored over the names of Park, Williams, Krumwiede, Zingher, Solly, Banzhaf, and many others and we note that there has been no contribution in this field issued as a publication of the Department of Health since 1929, we can only hope that when the new organization and personnel and duties are all developed into a smoothly working machine there may be a renewed

output of scientific contributions The last monograph appeared in 1920 The last reprint appeared in July 1929 The last volume of collected studies covered the years 1920-26 For it is as true now as ever that inquiry, research, and investigation are the very life of any administration of public health, if a city department is to escape the mental atrophy of bureaucracy

5 Maternity, Infancy, and Child Hygiene

This is the largest field of all, and is closest and of most concern to the private practitioner of medicine In no other specialties of medicine have the contributions been greater in the saving of lives than in obstetrics and pediatrics The records of performance of New York City in these fields have been notable, and promise of even better appears to be within our grasp The same comment that has been made with regard to independent dispensaries for syphilis and tuberculosis applies also to the conduct of independent prenatal dispensary services These should be operated only in connection with maternity services of hospitals, by members of an organized hospital staff, and so far as municipal services are concerned by the Department of Hospitals and not the Department of Health In no aspect of work of the Department of Health has the cooperation between the organized medical and nursing services been closer than in the field of maternity, particularly through the Advisory Obstetrical Council of the Department of Health and the Maternity Center Association and the Visiting Nurse Services of all Boroughs

6 Public Information

So-called public health education has been for years hamstrung by parsimony Lack of imagination in the appropriating body and resulting starvation of the educational resources of the Bureau of Public Health Education have been of long-standing It is not publicity, nor propaganda, nor promotion, nor advertising, that is wanted or should be paid for by the city, but education, first of physicians, then of school teachers, editors, ministers, public officers, employers of labor, of special groups of employees in hazardous trades, and lastly and least profitably, the indiscriminate and undiscriminating general public which is largely uneducable by any such broadcast methods as the Health Department can afford

The people of New York and particularly the medical profession have a right to expect that those who speak or write of health should be themselves by education and experience competent in human biology and medicine It is not enough that an employe within the Department of Health has a glib facility in speech or a journalistic knack with headings and slogans If he ventures to give health instruction he must know more than what he gives word to, and he must be responsible as a member of a disciplined profession for the contents of his teaching

Let it be borne in mind always that the most effective permanent educational service for health is that delivered in person and by word of mouth by the public health nurse to the family in the home It must be apparent to any thoughtful student of that engrossing and ever more exacting specialty of medicine, health education, that success will depend upon the intensity and competence of its specialization as a product of our knowledge of human biology

Summary

Progress in public health will not follow a policy of expansion into the field of organized care of the sick, nor will it gain credit for competent performance if it becomes the stubby tail wagged by the big hybrid dog of relief and social uplift

The "philanthropoid" who wishes to help others as well as himself by distributing other people's money to the deserving public, is always with us, but the future of public health, as I have defined it, depends upon the professional competence and responsibility of officers of civil government serving their local communities with resources provided by taxation

Public health training and experience are disciplines in the medical sciences to

be engaged in by physicians, sanitary engineers and their associates in the technical fields of vital statistics, laboratory work, and educational psychology

Public health work in this and in most other cities of the United States is on the whole so incomplete and so crudely done that it will take all the determination of such nonpartisan civil governments as our present one in New York City, and all the art, ingenuity, and science of the staff of the Department of Health of the city strictly applied to the standard functions and pressing problems of local public health, to bring the performance up to the highly creditable level which the medical profession and the informed public of this city expect.

To arrive at this point all activities not strictly of a public health nature as above defined should be turned over to governmental and voluntary agencies for care of the sick and to the practitioners of medicine in their private capacities

630 W 168 St

WE ARE GLAD TO PUBLISH THIS REQUEST IN THE EFFORT TO FORWARD ITS PURPOSE—*Editor*

All Physicians living in New York State *during any part of the World War and serving* in the Army, Navy, Red Cross, Draft Board or in any other capacity pertaining to the War, are requested to fill out this questionnaire and return it to Academy of Medicine, *13 Prince Street, Rochester, N Y* The information will be used in a history to be written on the work of physicians of New York State in the World War

Name Address

Date and Place of Birth

College and year of graduation

Other degrees or special study

Rank, Organization and Station in World War

Citations or Decorations

Date of Commission and Discharge

If not in military service, give type of other service in connection with the World War, with length of period and other particulars

Write any data, bits of information or true story, which will be of interest in this history

TINEA CAPITIS IN AN ADULT

H V MENDELSOHN, M D and E MUSKATBLITT, M D, *New York City*

From the Department of Dermatology and Syphilology, New York University and Bellevue Hospital Medical School service of Dr Howard Fox and Dr Edward Maloney, and from the Department of Dermatology and Syphilology, Sydenham Hospital, service of Dr Theodore Rosenthal

Cases of ringworm infection of the scalp in adults are sufficiently rare to justify the report of the following case

Case Report

T B, a white American houseworker, aged fifty-one, complained of pruritus of the scalp with some loss of hair of five months duration Eight months ago she acquired a dog and shortly prior to the onset of her condition, the dog developed "bald spots" on the ears which were completely cured with a "sulphur" salve She had had no previous cutaneous disease and her general past history was irrelevant.

Examination In the midoccipital region, longitudinally, were two discrete, nickel-sized, round, slightly elevated, scaly patches, with no evidence of central clearing The scales were of dirty grayish color and moderately adherent to the skin The hairs in the patches were irregularly "clipped" short near the scalp or had fallen out producing the effect of partial baldness The stumps were easily epilated. There were also a few lustreless, dry, long hairs which broke upon slight traction The follicular openings, more especially those from which the hairs had fallen, were elevated and prominent. On gently scraping the scales, a slightly hyperemic area was presented. On the vertex of the scalp there was an oval, kidney-bean sized similar patch and along side of it was a tuft of hairs encircled by gray scales and debris

Microscopic examination of a broken hair from one of the lesions prepared in a thirty per cent solution of potassium hydroxide showed it to be covered by a grayish mass of closely packed, small, polygonal spores, which were of uniform size and shape No mycelial filaments were seen This was the typical picture of a microsporon

Cultures were made in tubes and flasks on Sabouraud's medium (using original French glucose and peptone) In the beginning the cultures in the tubes were white and downy, with a central button from which a few deep grooves radiated to the periphery, dividing the surface into convex sectors These sectors were further subdivided by shorter and more shallow grooves Later an abundant white down developed at the periphery forming an elevated

Fig 1 Tinea capitis in a woman aged fifty-one two discrete, nickel-sized, scaly patches with no central clearing

Fig 2 Photomicrograph showing portion of a hair invaded by microsporon lanosum. Spores are not within the hair, but form a spore-case around it

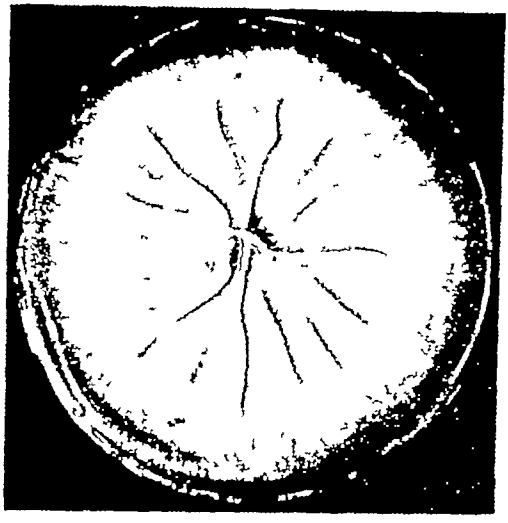

Fig 3 Culture of microsporon lanosum on Sabouraud's medium—at thirty days Periphery white and downy, center brownish and powdery Deep grooves divide surface into convex sectors which are further subdivided by shorter and more shallow grooves

Fig 4 Photomicrograph of teased culture preparation, stained and mounted in lacto-phenol-blue, showing large multiocular, spindle-shaped spores with thick walls. Dots on surface indicate spiny protuberances

ring around the central area which became brownish and powdery The growth in the flasks was eight cm in diameter at the end of one month

Microscopic examination of the culture showed a network of septate and branched mycelia and three types of spores including (1) chlamydospores—large globular or ovoid cells with a heavy membrane situated along or at the tips of mycelial hyphae, (2) small lateral conidia, attached to simple or slightly branched hyphae, (3) large multilocular, spindle-shaped spores with thick walls, studded with spiny protuberances

Comment

There are two distinct and unrelated forms of organisms capable of producing ringworm in the scalp—the microsporons and trichophytons The former are responsible for about ninety per cent of cases in this country The microsporons are of human or animal origin, the microsporon Audouini being the most important organism in the group of human origin and the microsporon lanosum is the outstanding representative of animal origin

The patient having been exposed to a dog with "bald spots" on both ears, this pointed to the likely source of infection The microsporon demonstrated on microscopic examination of an infected hair, suggested a variety of animal origin This was proven by the gross and microscopic findings of the cultures The morphology established the fungus as microsporon lanosum

Summary

A case of tinea capitis in a woman aged fifty-one, is here presented The patient had been exposed for some time to a dog with "bald spots" on the ears The causative organism was the microsporon lanosum which was identified by microscopic examination of an infected hair and by culture

The Supreme Court of Indiana has ended the "gin marriage racket" described in these pages in the March 1 issue. It is "the most pleasing bit of news we have read in recent weeks," says the state medical organ

---

"Every time I have caught hell it has been the result of pursuing it."—*Ed Howe*

The law requiring prenuptial medical examinations in Illinois was followed by a drop in marriage licenses of seventy-four per cent in the downstate counties in the last half of 1937 as compared with the same period in 1936 In Cook County (Chicago) the reduction was forty-nine per cent. Many couples went to neighboring states to wed.

Preventive Medicine

ANTISYPHILIS PROGRAM IN NEW YORK CITY

Enlisting the Cooperation of the Private Physician

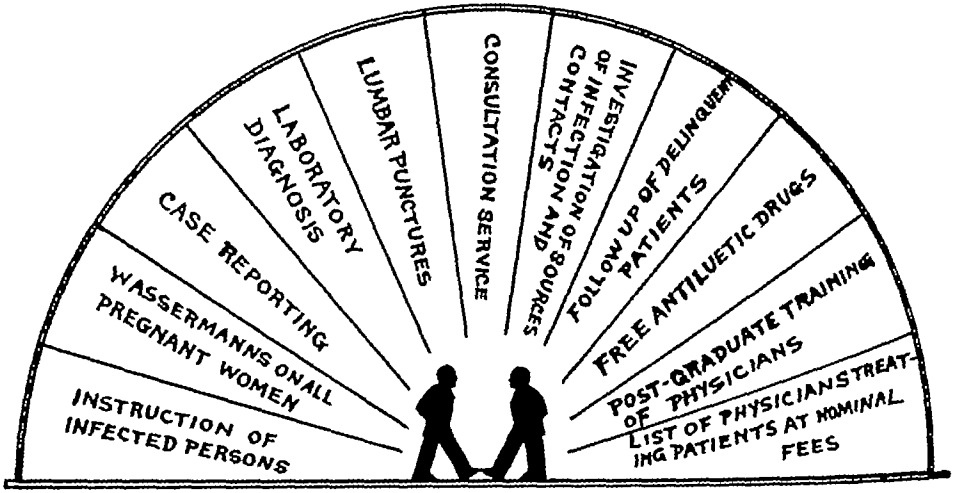
THEODORE ROSENTHAL, M D and JOSEPH WEINSTEIN, M D
M S P H, *New York City*
Director (TR) and Epidemiologist (JW) Bureau of Social Hygiene Department of Health, City of New York

The interdependence of the Health Department and the medical profession in the successful prosecution of a plan for syphilis control cannot be overemphasized United and sustained efforts of both groups are necessary if permanent gains are to be made. Due to the widespread publicity given the venereal diseases, the private practitioner is probably seeing a larger number of syphilis patients than he had previously seen Since a considerable proportion of afflicted individuals are cared for in private practice and because of the important part of treatment as a factor in control, the cooperation and participation of the medical profession is urgently needed if syphilis is to be eradicated

Indeed, the importance of such relationship has received primary consideration in the antisyphilis drive under the present health administration in New York City Diagnostic, consultation, treatment, and epidemiologic services as well as antiluetic drugs have been made freely available to practicing physicians wishing to cooperate with the Health Department. Physicians reporting cases of early syphilis, syphilis in pregnancy and congenital syphilis, and those desiring to utilize the Health Department facilities, are contacted by medical epidemiologists These men acting as liaison officers, are responsible for the promotion of cooperative relationships between the Health Department and the individual medical practitioners A brief description of the activities of the medical epidemiologist in relation to private physicians will be of interest.

On the first interview with a private physician, an effort is made to secure the desired information on the case in question and to outline to him the Health Department facilities in connection with the control of venereal disease The physician is informed of the free dark-field, blood and spinal fluid examinations, the consultation service, lumbar punctures, and the supply of antisyphilitic drugs He is urged to utilize the epidemiologic services for the investigation of sources of infection and the follow-up of contacts and lapsed cases He is invited to take advantage of the clinical conferences held at intervals during the year and to avail himself of the opportunities for postgraduate training, offered by the Health Department Attention is called to his responsibility of reporting all cases of syphilis coming under his care, including new cases, delinquents, and sources of infection, his duty of furnishing all affected individuals with circulars of instruction regarding the nature of the disease, the importance of adequate treatment, and the precautions to be taken against the spread of infection to others is pointed out. The importance of routine Wassermanns on all pregnant women in the prevention of prenatal syphilis is strongly emphasized. While advice on different phases of syphilis is generally given when requested, every opportunity is taken to stimulate a demand for such advice Interviews are conducted at convenient hours in doctors' offices, in hospitals and clinics, and at the Bureau of Social Hygiene.

In order to procure antiluetic drugs, a physician is required to apply to the Bureau of Social Hygiene on a prescribed form, giving the name and address of the patient and the stage of the disease Following the receipt of this requisition, an epidemiologist is assigned to interview the doctor The conduct of such an interview has already been described Standard preparations of an arsenical and heavy metal (neoarsphenamine and bismuth subsalicylate in oil) are furnished in four allotments



sufficient for one year of treatment and free of cost to the physician for all cases of syphilis regardless of the economic status of the patient Physicians are thus enabled to care for a larger number of persons at reduced fees and maintain contact with many individuals who otherwise would be lost to public clinics

Much of the success in the control of syphilis by epidemiologic methods depends upon how much of this work will be done by the private physician in cooperation with the Health Department When contact is made with a practicing physician, his cooperation is sought in identifying, examining, and reporting sources of infection and contacts to cases of syphilis coming to his attention Special emphasis is placed on early syphilis, syphilis in pregnancy, and congenital syphilis The epidemiologist offers his services, but no investigation is undertaken without the specific approval and consent of the doctor Practitioners often request epidemiological investigations at the time they report their cases to the Health Department. In every instance, the physician is assured of the confidential nature of the information given by him or by his patient, so that there is no possibility of endangering the reputation or character of the patient or his contacts

Not infrequently, the physician will arrange for the epidemiologist to interview the patient at home or at the doctor's office Some cooperating physicians prefer to introduce the epidemiologist as a personal friend called in consultation at his office. Whatever the method used, the patient is approached in a tactful and kindly manner The importance of identifying suspected sources of infection and the examination of family contacts is carefully explained to him, regularity and adequacy of treatment is stressed, and the dangers of lapses in treatment are pointed out The confidential nature of the information given by the patient is always stressed Every effort is made to conserve the relationship between the physician and his patient.

Practical experience has shown that patients in private practice welcome a sympathetic interview with an epidemiologist. They consider the action on the part of their doctor as unusual interest in the welfare of the patient and his family The trustworthiness and confidence in the family physician is thereby greatly increased It is a matter of record that each case thus investigated, has always resulted in the examination of family contacts and in the prevention of lapses in treatment Furthermore, such cooperation has caused the examination and treatment of identifiable sources of infection by private practitioners to the complete satisfaction of the Health Department and the cooperating physicians

The follow-up of lapsed cases upon request of private physicians is usually carried out by nurse epidemiologists Special cases however, are referred to medical epidemiologists for investigation. Every

DEPARTMENT OF HEALTH AND PRIVATE PHYSICIAN INTERRELATIONSHIP IN SYPHILIS CONTROL

effort is made to return these delinquents to the referring physicians for further treatment.

Consultation services are provided to private physicians through the medical epidemiologists and through specially qualified clinicians-in-charge of Health Department diagnostic and treatment centers Requests for consultations are daily received by the Bureau of Social Hygiene pertaining to matters of diagnosis, treatment, prognosis, and public health aspects of syphilis Advice is given by epidemiologists at doctors' offices or at the headquarters of the Health Department, and occasionally by telephone Certain cases which in the judgment of the epidemiologist require special skill in differential diagnosis or expert advice on treatment are referred to the physician-in-charge of the Central Syphilis Clinic of the Health Department. The clinician and epidemiologist meet with the private physician and his patient, by appointment, at the Clinic The patient is examined, the case is carefully reviewed, and an opinion is rendered by the consulting physician

It is too early to quote statistics, but it can be stated that definite progress in the participation of the private practitioner in the syphilis control program has been made. This may be seen from the increasing numbers of physicians reporting cases of syphilis by name and address and requesting antiluetic drugs and epidemiologic investigations With the free supply of drugs, many physicians have generously given their services gratis to persons lacking funds for medical care. The respect and confidence of the medical profession in the Health Department is indicated by the numerous requests for consultations on matters of diagnosis, treatment and social aspects of syphilis, and by the large numbers of practitioners eager to enroll in the classes for postgraduate instruction given by the Department of Health in the modern methods of diagnosis and management of this disease.

Case Reports

The following cases are cited because they illustrate the importance of cooperation and participation of the private practitioner in the war on syphilis·

CASE 1 Dr M.L. was visited in response to a request for antiluetic drugs for a case of primary syphilis The following information was of interest The patient had a sore on his buttock and enlarged inguinal glands stated to have developed several weeks after exposure to an out-of-town prostitute Because of the suspicious character of the lesion, a darkfield examination of the serum from the sore was made, which proved to be positive for the Spirochete pallida The blood Wassermann had a four plus reaction

This case is quoted because it indicates the importance of a darkfield examination of every suspicious lesion in the diagnosis of early syphilis

CASE 2 A private physician was contacted following a request for consultation on the treatment of a case of syphilis in pregnancy The patient, then seven months gravid, had been for five months under prenatal care of another doctor, and not until she came to the attention of the second physician referred to above, had her blood been examined for syphilis She had a strongly positive Wasserman reaction and admitted antiluetic treatment several years previously She subsequently gave birth to a premature syphilitic baby

This case points to the necessity of routine Wasserman testing of all pregnant women Had the expectant mother been investigated for syphilis early during pregnancy and treatment been instituted in time, congenital syphilis in the baby probably would have been prevented

CASE 3 Dr E H. requested investigation of a patient who discontinued treatment for syphilis while still infectious The patient was contacted, the necessity for continuous and adequate treatment was explained to him, the dangers associated with lapses in treatment were emphasized, and the possibility of spreading the infection to others was pointed out. He returned to his physician for further treatment and brought his wife for a physical and serological examination She was found to be syphilitic and was placed under care of the same physician.

Proper instruction of the patient with syphilis is necessary to insure continuity in treatment and the examination of family contacts

CASE 4 Dr C B requested investigation of a case of syphilis with secondary manifestations alleged to have been caused by bites of bed infesting insects After the patient had been carefully and tactfully interviewed by one of the writers, he finally admitted sex relations with a girl in Pennsylvania, about six weeks prior to the appearance of his skin eruption He was persuaded to correspond with his girl friend, urging her to undergo a thorough medical examination. A communication from a private physician in Pennsylvania to the doctor referred to above, showed that the girl was found

to have syphilis and that she had placed herself under his care and supervision

Thus, a tactful and time-consuming interview with a patient in private practice was necessary in order to elicit the desired information for the identity of a source of infection.

CASE 5 Dr D reported a case of primary syphilis to the Health Department and requested a supply of free antiluetic drugs The family contacts showed no evidence of venereal disease. The source of infection had been examined by the doctor and found to have syphilis in the secondary stage. As she failed to return for treatment, she was further investigated by one of the writers with the consent of the referring physician A communication from the Health Officer in Hoboken, N J, indicated that she was then under medical care in that city

A good example of case investigation in private practice on a cooperative basis is thus apparent.

CASE 6 Dr M.E transmitted the following information by telephone to the Health Department. A sixteen year old girl who had been diagnosed by him as a case of secondary syphilis with active skin lesions, was employed as a nursemaid for a five year old female child and was to leave the City on a long trip with the family, on that night

Immediate action was taken by the Health Department. The patient was removed to a hospital for isolation and proper medical care. The household contacts were induced to be examined by their family physician, they were found to be free from evidence of venereal disease. The alleged source of infection, unfortunately, could not be located on account of insufficient identification. Thus, through the cooperation of a private physician a highly infectious case of syphilis and a potential source of infection was isolated and brought to proper medical treatment.

CASE 7 Dr B J reported a case of syphilis with secondary manifestations in a young female who had had five blood transfusions because of a puerperal septicemia. Ten persons, including the blood donors and other family contacts, were investigated and examined—with the consent of the attending physician The patient's husband, who acted as the last donor, was found to have a strongly positive Wassermann reaction and was considered to be the source of her infection. The doctor offered to treat both husband and wife at a nominal fee in line with the economic status of the family and to keep their six months' old baby under close observation until the danger of syphilitic infection from the mother had passed. The Health Department furnished a supply of free antiluetic drugs. This case illustrates the combined efforts of the Health Department and the family physician in the investigation of a source of infection, the examination of contacts, and the institution of proper treatment.

Summary

Contact relationships of the Health Department with private physicians on a cooperative basis are valuable in an antisyphilis campaign. They fully justify the expenditure of time, efforts, and public funds, because they aid in case finding, case holding, case treatment, and case prevention A start in this direction has been made Further and continuous efforts are needed in order to accomplish measurable results

The Health Department has provided special services to help the private physicians in their problems of diagnosis, of keeping their patients under treatment, and in identifying and bringing to medical attention contacts and sources of infection. While the medical profession is greatly encouraged to utilize all the available facilities, the cooperation of the practicing physician is particularly needed in the following activities

The general use of the darkfield examination of all suspicious lesions on the skin or mucous membranes, genital or extragenital, in the diagnosis of early syphilis, routine Wassermanns on all pregnant women, regardless of social status, complete case reporting and a more widespread use of the epidemiologic services of the Health Department This would result in the discovery of many more cases of syphilis and the elimination of more sources of infection The vast majority of the cases thus uncovered would place themselves under the care and supervision of these practitioners Not only the infected public, but the medical profession would greatly benefit by such procedure

---

Levity greeted Dr Rollo N Harger of the Indiana University Medical School several years ago when he exhibited his "drunkometer" at a state medical meeting Now it has been accepted in court, its findings have been admitted as evidence, and Dr Harger has the laugh on his skeptical confreres

EDITORIALS

Dr William A Groat

The Medical Society of the State of New York, through the arrangements of its executive machinery, elects a President-Elect who, during a sabbatical year, familiarizes himself with the actual workings of the Society

Last year the State Society gave this honor to Dr William A Groat. That our members may know something of the man who now takes the lead as our Chief Executive, it is well to know that he has been in practice in Syracuse since 1901, and is a member of the College of Medicine of Syracuse University He has belonged to this group since 1902 He has been professor of clinical pathology since 1911, and he has very many other professional connections

During the War Dr Groat served in the Medical Corps of the Army, and is now a Lieutenant Colonel in the Medical Reserves He has been a contributor to medical literature within the medical field of his particular interest He has served the Medical Society of the State of New York in various capacities He has been in charge of the fifth District Branch, he has been in charge of our scientific programs and exhibits, and he is well-known to those who have worked with him for seasoned judgment and philosophical consideration of matters that come to him for survey and decision

The Medical Society of the State of New York may feel sure that under his guidance our prestige and progress will continue

Another Health Survey

To physicians there seems little need of another health survey in this state Federal investigators, medical societies, public health agencies, and welfare groups have accumulated enough up-to-date information in the past few years to furnish an accurate picture of the health of the people of New York

Apparently Albany wants to see for itself, however Governor Lehman's signature of the Wagner bill creates a temporay commission to study state health and formulate a long range program to maintain and improve it

On the basis of experience and fitness one would expect a body investigating health conditions to consist principally of physicians Not so the Wagner commission, however Of thirteen members only one must be a medical man This does not promise well for the technical background of any recommendations made

Fortunately the commission has other sources of information and guidance if it chooses to draw on them The Medical Society of the State of New York has enunciated principles of medical care

which would provide adequate, high grade service for all the people of the state without drastic changes in our present system of practice or impairment of professional standards

Assemblyman Wagner, like his father, has leanings toward compulsory sickness insurance It is to be hoped that this will not color the findings and recommendations of the commission of his creation

There can be no better antidote to such a tendency than Surgeon General Parran's recent address before the American College of Physicians Dr Parran speaks on public health and its attainment with an authority equalled by few other persons in this country Like organized medicine, he objects that sickness insurance extends inadequate protection at exorbitant cost to the small wage-earner It neither prevents disease nor improves the quality of medical care

An adequate solution of the health problems of this state must include the unemployed and nonindustrial workers as well as those employed in industry It must provide for protracted illnesses as well as the acute infectious and surgical diseases Above all, it must respect the paramountcy of medical considerations in the distribution of medical service

Summer Study

Summer, with its usual slackening of practice, is an ideal time for graduate medical education Practitioners who cannot spare time for intensive study during the busy winter months should start now to plan "refresher" courses

The ideal graduate work is formal—classroom or clinical instruction or preferably both combined In formal courses attendance is fixed for a regular hour and there are no distractions of telephone or doorbell Unfortunately opportunities for this type of study are not easily accessible to practitioners in remote districts

In Illinois the State Department of Public Health, in cooperation with the Educational Committee of the State Medical Society, offers a one-week summer course in obstetrics and pediatrics at the University of Illinois College of Medicine The course is repeated seven times during the summer to enable practitioners from all parts of the state to select a convenient time This idea could easily be adapted to the local needs of other states and of smaller units within a given state

For the physician unable to leave his practice for the time required for a regular course, the printed word must take the place of other instruction The development of library facilities is a prime duty of every county society

The package service of the Library of the American Medical Association is open to all members and to subscribers to any of the Association's publications New York medical men account for over a hundred packages each year Illinois takes four times as many This apparent disproportion is largely due to the Library of the New York Academy of Medicine, which supplies the needs of the physicians of the Metropolitan Area

This is a good time for the doctor to start planning his summer study Decide on the subject which interests you most and lay out a schedule of warm weather reading After a day's fishing or a good game of golf a textbook may not be as enjoyable as a detective story but it will prove a great deal more profitable in the long run!

More About Tobacco

There has been a great deal written concerning the effects of tobacco and nicotine on the organs of circulation A close analysis of a considerable amount of the literature reveals that much of the work was not subjected to adequate control The prevalent conception that nicotine is responsible for the production of lasting lesions of the heart and blood vessels seems to be refuted by the recent experiments of Thienes and Butt[1]

Rats and rabbits were divided into two

1 Thienes, C. H. and Butt, E. M., et al *Am. J Med Sc*, 195 522, 1938

equal groups, one receiving injections of nicotine, the other injections of saline solution This was continued for a period of from three to six months, at the end of which time the animals were killed and the tissues examined histologically Lesions were found in the media of the aorta in two nicotine-injected rabbits, two control rabbits, and one control rat, and a thickening of the coronary artery was found in one control rabbit. No other lesions were noted throughout the circulatory system The fact that degenerative changes occurred in both the control and test groups—but more so in the former—would indicate that nicotine in itself does not produce organic cardiovascular disease.

In this connection, the observations of Silbert[2] anent the deleterious effect of smoking on thromboangiitis obliterans deserves mention From the work of Thienes and Butt, it seems that tobacco is not the inciting causative factor of the disease but rather, because of its vasoconstricting action, tends to aggravate a previously existing vascular disease of other etiology Hence the beneficial results notedly following the withdrawal of tobacco in cases of thromboangiitis obliterans

Beyond the known tissue reactions of the upper respiratory tract to the inhalation of tobacco smoke, its role as an etiological factor in the appearance of organic disease remains doubtful It is highly probable that by its transient action on the peripheral circulation it exaggerates the effects of an existing poor blood supply This, in short, is the substance of our knowledge of the pathological effects of tobacco at the present time

Thrombocytopenia A Step Forward

One of the most severe forms of purpura is that which is commonly known as purpura hemorrhagica, or *morbus maculosus* of Werlhof It manifests itself most frequently in adolescent females as a disease characterized by debility, bleeding from one or more of the mucous surfaces, and numerous purpuric spots distributed over the entire skin It is distinguished by the marked decrease in the number of blood platelets, a prolongation of the bleeding time and a blood clot which is soft and non-retractile These factors serve to differentiate this disease from hemophilia for which no cure is known However, a successful remedy for thrombocytopenia (purpura hemorrhagica) is available by the surgical removal of the spleen

Why splenectomy should influence favorably the course of this affliction with its malignant possibilities has until now not had adequate scientific explanation Clinical proof of the value of this surgical procedure has been abundant, but it is only recently that definite evidence has been presented to establish the rationale of this surgery for the relief of hemorrhagic purpura Troland and Lee[1] subjected the spleens removed from cases of thrombocytopenia to maceration in a food-chopper, extraction with acetone, distillation of the fluid, and the solution of the yellowish-brown precipitate in distilled water This substance which was finally recovered from the spleens of thrombocytopenic patients, and which the investigators allude to as "thrombocytopen," is able to reduce the platelet count of a normal rabbit by as much as 90 per cent, following injection into the blood stream Within twenty-four hours, a count of 620,000 platelets was reduced to 58,000 after injection of the splenic extract The amount of the dose administered was not the responsible factor since small quantities yielded the same results as those obtained by the use of twenty c c of the splenic extract

Troland and Lee have subjected control animals to identical extracts obtained from the spleens removed from patients suffering with Banti's disease and hemolytic jaundice None of these experimen-

[2] Silbert S *S G&O* 61 214, 1935

[1] Troland, C. E. and Lee, E. C. *Bull Johns Hopkins Hospital* January 1938

tal animals showed a decrease in the platelet content It seems evident therefore that the splenic tissue in cases of purpura hemorrhagica contains some substance which either destroys the available platelets or inhibits their formation While chemically the substance as yet has not been identified, this pioneer study affords substantiation of our clinical experience in the recommendation of operating for thrombocytopenia

CURRENT COMMENT

"IT IS A GLOOMY MOMENT in history Not for many years—not in the lifetime of most men who read this—has there been so much grave and deep apprehension, never has the future seemed so incalculable as at this time. In our own country there is universal commercial prostration and panic, and thousands of our poorest fellow-citizens are turned out without employment, and without the prospect of it. " When worrying too much about today remember that the following article is reprinted from *Harpers Weekly* of the issue dated October 10, 1857, 81 years ago—The Saint Louis County Medical Society *Bulletin* of April 22, brought the above to our attention

"WE STARTED OUT WITH A constitution that was brief, pithy, to the point and flexible, asserting that God had created all men free and equal This almost sacred document so arranged its provisions that a man was given a chance to prove himself capable of being a respected member of a group of self-respecting, sane men

"And the whole experiment started, constitution and all, if memory reminds aright because a short-sighted British king wanted his peaceful colonists to pay a tax on tea And that small, almost casual levy was the last straw the patient colonists could stand

"What, in the name of all common sense, would Patrick Henry say if he came back to earth today?

"He would find not only tea taxed but the very country that he and his associates sought to rid of imposts, staggering under more laws, more levies, more handicaps and more bureaucracy than did France itself when the streets ran red and Mirabeau and Danton called the turn on a situation that made France the keystone of European governmental crisis "—One way of looking at it, as expressed by the April issue of the *Illinois Medical Journal*

A NEWS NOTE from Czechoslovakia tells us that "The Institute of Social Medicine of the University of Prague, has made known its program for the complete teaching of social medicine Whereas this was done only in parts, the curriculum now calls for two full semesters Five hours a week are devoted to fundamental teaching two hours to lectures, and three hours to the visiting of institutions, factories and public service institutes Pathology, social hygiene, public health, and curative medicine are taught by professors selected for their experience in social medicine.

"In the first semester the students are taught the elements of general statistics, physical training, foods, and housing Prenatal and postnatal care, child-welfare, school problems, deafness, blindness, and industrial hygiene are completely covered by the program. Besides, the students receive instruction in the problems of social insurance, hospital organization, accidental invalidity, and homes for the aged

"If all these things are more or less familiar to Americans, it is to be pointed out that such courses are rare even in this part of highly civilized Europe"—*Medical Record* for April 6, 1938

" WHATEVER HAS BEEN GOOD for the health needs of the people has come forth from within the ranks of the profession, and never from outside agencies Whatever progress has been made has been inspired and developed by our own students, men of research, investigators and members Whatever were the medical needs of any emergency in any community, county, state of the nation, accredited representatives from within the profession formulated and applied the solution When, a few years ago, there were some who asserted that people were in want of medical care the investigations and inquiries revealed that such assertions were unfounded and without warrant "—Part of a discussion of "What's Wrong" contained in the April *California and Western Medicine*

"What have you done for my wife?"
"She has an imaginary ailment"
"What did you give her?"
"An imaginary medicine"
"Then I will send you an imaginary check"—*Medical Record*

Public Health News

Your Correspondent Visits Washington

J Rosslyn Earp, L R C P , Dr P H
New York State Department of Health

The A.M.A Journal (p 652, February 26, 1938) introduces its editorial on "A National Health Program" by pointing out that the names of the committee members who are responsible therefor have not been supplied. More than one member of our own State Society in conversation has assumed that the report was prepared by lay members of the Interdepartmental Committee While in Washington for the meetings of the State Health Officers last month I secured the names of the Technical Committee on Medical Care, which are as follows Martha Eliot, M D (Children's Bureau), *Chairman*, C E Waller, M D , J Mountin, M D and G St. John Perrot, Ph D (U S Public Health Service), and I S Falk, Ph.D (Social Security Board) It is true that none of the physicians on this committee are engaged in the practice of medicine but then it is difficult to see how a committee derived from government employees could include such practitioners It is expected that an opportunity will occur shortly for the presentation of the practitioner's viewpoint when at the President's request Miss Roche will call a conference in Washington for the discussion of a plan to implement a program of national health

At the opening session of the State and Territorial Health Officers' conference with the Surgeon General, a reference was made to the subject of health insurance by Dr Earl B McKinley, Dean of the School of Medicine of George Washington University His discussion on medical economics came rather unexpectedly at the end of a paper on the cartography of disease. The experiment in group health, which was promoted by the Home Owners Loan Corporation last year came in for his special castigation Such schemes, he said, will fail of their own inadequacy because of their ultimate inefficiency and the impossibility of enlisting professional personnel of high quality to carry on such work. As an alternative to health insurance he proposes the extension of public health He mentions medical subsidy to the indigent and the desirability of a national health program

At the time of his attack on Group Health Association, Dr McKinley might well have been taken to represent the physicians of the organized profession in the District of Columbia At least the Washington newspapers have reported what they had assumed to be a controversy between the Medical Society and the Association ever since the beginning of November last year Oddly enough, however, on the very day after Dean McKinley's address the newspapers made public a letter by Dr Thomas E Neill, President of the District Medical Society to the president of Group Health Association, in which he wrote

> These statements suggest that the Medical Society is opposed to such programs and has adopted obstructionist tactics, has refused to cooperate and is trying to block such programs On the contrary, the Society has long recognized the need for better medical care for persons of low income and we are earnestly seeking a sound, safe, satisfactory solution of the problem
>
> The Society is willing to cooperate with any lay group, including Group Health Association, in setting up and carrying out a program to this end. The only conditions are that the programs must be legal, ethical, economically sound and provide service in conformance with recognized medical standards
>
> We sincerely believe a program can be worked out under these conditions, which will provide adequate medical care for persons of low income, free choice of physician and a system of regular monthly payments, in the nature of insurance premiums

Whether or not Dean McKinley represented the District Medical Society, there was no doubt that the American Medical Association was represented at our Washington conference by Drs Leland and Woodward Dr Woodward has a very simple solution for the problem of providing medical care to the indigent he would abolish indigency If people had enough money, they would have less disease and would be able to pay for adequate care of such disease as remained Dr Parran acknowledged the truth in this contention "The inter-relationship between poverty and disease is well known," he said, but he added "Our ability to prevent disease far exceeds our ability to control causes of poverty" Medical care can be made available to all and the quality of medical care improved without any basic change in our present system of medical practice What he recommends is "only an extension on a scale adequate to meet the needs, of methods and actions that now are in operation"

Difficulties Encountered in Industry

Tubercle, the British journal of tuberculosis, has been published continuously for about two decades Its first editor was Dr J Rosslyn Earp, who has for the past several years distinguished himself in the field of tuberculosis and public health in the United States With the December 1937 issue, Tubercle has put on a new and beautiful typographical dress and added the subtitle "A Journal of Diseases of the Chest" Tubercle has many appreciative readers in this country, for the practical problems of tuberculosis control in the two countries are almost identical Tuberculosis Abstracts congratulates Tubercle from which it has, in the past, drawn aid, and presents in this issue brief abstracts of a symposium on the difficulties encountered in dealing with the tuberculosis problem

Enlightened industry nowadays realizes that it must carry a certain number of subnormal individuals In the long run this is sound economic policy, for industry cannot afford to lose trained employees nor to breed psychological unrest of workers caused by the knowledge that loss of employment will follow serious or prolonged illness Yet the employment of workers who have tuberculosis, or have recovered from the disease, is an exceedingly awkward problem for tuberculosis is insidious and infectious and leaves its sufferers incapable of normal physical effort for long periods

Economic difficulties experienced by the tuberculous wage earner are serious They are partially relieved by continuing part wages Treatment in the sanatorium is rendered easier and more effective if the worker is relieved of immediate worry and is given hope for the future. It reduces the temptation to return to work too soon

Environmental difficulties are particularly acute in working-class areas The problems of slums, overcrowding and undernourishment are being solved by the slow social evolution now going on.

Difficulties arising out of the patient's own attitude include, (a) fear of losing his income, (b) his job, and (c) fear of the sanatorium These fears can be greatly allayed if the policy of the firm is to take back employees when they have recovered The dread of the sanatorium can usually be overcome by education and wise propaganda

The difficulty of returning to a different kind of work than that to which they have been accustomed must be faced by some workers A man must know that his job is a real one and not one created merely to find him employment.

The employer's difficulties must be faced squarely The returning tuberculous patient has usually a greatly reduced efficiency He is inferior to the normal worker and this inferiority is likely to persist for a few years If he attempts to keep pace with fellow workmen he invites early breakdown Industry quite naturally, is not likely to welcome the worker who needs a sheltered life if he is a new entrant but most employers will take back old employees if the prospect of eventual return to reasonably good health exists Of course, industry has to deal with many employees disabled by conditions other than tuberculosis With these "crocks" the returning tuberculous worker has to compete for the suitable jobs Many are the employer's problems in adapting the needs of industry to the employee who cannot be subjected to strains such as overtime work, shift and night work, and competition with more vigorous workers.

It is, of course, not possible to pay higher wages to the tuberculous patient than to other workers In fact he must often be satisfied with a lesser wage This means that at the very time he needs a higher and better standard of living, he actually has to be content with a much lower one. This situation calls for generous cooperation between the employer and the Care Committee (well organized in England) The tuberculous patient returning to industry should be subsidized until he is able to earn a reasonable wage Industry cannot be expected to make the subsidy directly

The danger of infecting other employees must also receive attention A patient with a positive sputum should not be allowed to return to surrounding where he may infect others Certainly he should not be permitted to engage in industry involving the handling or packing of food or which requires him to come into contact with the public

The author urges close liaison between the tuberculosis service and industry Small firms find it particularly difficult to deal with recovered tuberculous patients but can do much if the facts about tuberculosis are carefully explained to them by the medical officer or doctor The doctor must not only be conversant with the disease but must also possess an intimate knowledge of the industry and requirements of the workers if he is to talk reasonably and convincingly with the management.

Medical News

Chemung County

Resolutions of regret and tribute to Dr Carl G Zimmerman, of Elmira, who died on April 7, were adopted at a special meeting of the Chemung County Medical Society

Dutchess County

Dr. Will Cook Spain, chief in allergy, Post Graduate hospital, New York city, was the speaker at a meeting of the Dutchess County Medical society on April 13

His topic was "Upper Respiratory Allergy"

Members of the Society joined with the Dutchess County Psychiatrical society in its meeting April 21 at the Wassaic State school. The speaker, Dr Charles G Kerley, consulting pediatrician in a number of metropolitan hospitals, discussed "Varied Manifestations of Thyroid Gland Derangements in Children."

Erie County

The Buffalo Academy of Medicine on April 27 listened to an address on "Some Immunologic and Serologic Aspects in Malignant and Chronic Infectious Diseases," by Dr Ernest Witebsky, Associate Professor of Bacteriology, University of Buffalo

A symposium on endocrinology was presented at a special meeting on May 4 by Drs D K. Kitchen and R. L Schaefer

Franklin County

Continuing the drive to reduce relief costs in Malone, the town board will inaugurate the last of the recommendations of the Malone Taxpayers' association, which was to establish a staff of doctors who will have complete charge of all medical and surgical work in the town

The cost of medical and surgical relief in Malone last year was $13,766 50 exclusive of hospitalization

The town board has engaged Dr H W Stoughton to take charge of all medical care of relief clients, including operations for tonsillitis at a salary of $3,000 per year

Dr John E. White will take charge of all surgical relief cases, his compensation to be at the regular schedule of fees for welfare patients Dr F E. Finney will take charge of all obstetrical cases at the regular welfare fee schedule.

Greene County

A special meeting of the Medical Society of the County of Greene was held at the Memorial Hospital of Greene County, April 28, to act on a resolution adopted by the Herkimer County Society to request the Board of Regents to adopt rules governing the granting of licenses to foreign physicians that shall be at least as rigid as those rules which would apply to American physicians should they attempt to obtain a license in those countries from which these men come

Kings County

The program of the Medical Society of the County of Kings on April 19 included

Presentation of portrait of Dr Luther Fiske Warren by the staff of the Long Island College Hospital and the Faculty of the Long Island College of Medicine through the Warren Society Presentation address John H Lathrop, D D Unveiling Charles Ford Warren, M D Acceptance Edwin P Maynard, Jr, M D, Associate Directing Librarian and Curator of the Medical Society of the County of Kings

Address "Allergic Manifestations of the Nervous System," Foster Kennedy, M D

Address "Modern Concepts of Mental Disorder," George S Sprague, M D

The concluding "Friday afternoon lectures" of the spring series at the MacNaughton auditorium were

Apr 22, "Friedländer's Bacillus Infections in Medical and Surgical Conditions," George Baehr, M D Apr 29, "The Proptosed Eye as a Diagnostic Problem," Ralph I Lloyd, M D May 6, "Recent Progress in Circulatory Failure," Arthur M Fishberg, M D

The Brooklyn Thoracic Society on April 14 listened to papers on "Hemoptysis of Obscure Etiology A Study of 145 Cases," Dr N M Levin, Associate in the Chevalier Jackson Bronchoscopic Clinic, Temple University Medical School Philadelphia, Pa and "The Pathology of Various Pneumoconioses," Dr Leroy U Gardner, Director, Saranac Laboratory for the Study of Tuberculosis, Saranac Lake, N Y

Dr. Harold R Merwarth, neurologist, and Dr Raymond L Pfeiffer nerve specialist, addressed members of the Kings County Medical Society on April 21 on

nerve disorders Dr Walter V Moore presided

Dr Harriet Alexander and Dr Sidney V Hass spoke on April 11 before the Williamsburgh Medical Society in the Leon Louria Memorial Auditorium of the Jewish Hospital.

Montgomery County

At the Meeting of the Medical Society of the County of Montgomery on Mar 31 in St Mary's Hospital, Amsterdam, Dr A L Soresi gave a lecture, illustrated with lantern slides, on cancer of the large intestine

Following the lecture, the meeting was thrown open to discussion in which the following physicians took part J B Conant, H M Hicks, W H Seward, E A Bogdan, L H Finch, and E G Gillmore

Monroe County

Doctors of Western New York and Northern Pennsylvania, alumni of the University of Rochester School of Medicine and Dentistry and former members of Strong Memorial Hospital house staff completed a two-day conference there on April 9

Discussions were led by Drs Clyde A Heatly, George Whipple, David A Haller, Willard Allen and Samuel W Clausen Colored motion pictures of the larynx were shown by Dr William A Lell of Philadelphia, a graduate of the school On April 8 the physicians and surgeons heard Dr C Sidney Burwell, dean of the Harvard Medical School and professor of research medicine, give the Eastman Memorial lecture at the hospital In his talk on "Factors in the Course and Prognosis of Heart Disease" he told of the advance being made in the battle against the many heart ailments

Nassau County

Formation of the Nassau Surgical Society, the first of its kind in the county's history, was announced on April 14 following a meeting at the Meadowbrook Hospital Dr Benjamin W Seaman is head of the organization, which is planning a program of activity independent of that carried on by the County Medical Society

Dr Richard Derby, a member of the County Board of Health, is vice president, and Dr Otto C Hudson is secretary Among the other surgeons active in forming the group are Drs Wesley Bulmer and Joseph B Conolly

The constitution, patterned after those of leading surgical organizations, provides that the purposes of the society shall be "the advancement of all branches of surgery in the county" The membership will determine at future meetings the methods of presenting interesting and informative discussions

Dr Seaman stated applications for membership will be received by invitation only, these to be extended to surgeons interested in all branches of the profession in Nassau County, whenever authorized by the society

Dr William J Steele, prominent South Shore physician, president of the Baldwin National Bank & Trust Company and formerly for more than thirty years president of the Baldwin School Board, died on April 21, at his home after a week's illness of pneumonia He was seventy-three.

Dr Steele, who had practiced there for thirty-nine years, had taken a leading part in the business, fraternal and civic life of his community He had served twelve years as postmaster of Baldwin and was prominent as a realty developer

He was one of the organizers of the Baldwin National Bank and Trust Company and was president since its organization

He was a member of the staffs of the Nassau Hospital, the South Nassau Communities Hospital and of Mercy Hospital, and is said to have officiated at the births of 5,000 children

New York County

Dr Bela Schick, discoverer of the Schick test for susceptibility to diphtheria, chief of the Pediatrics Department of Mount Sinai Hospital, New York, has received the award of the Addingham Gold Medal, a British honor for "the most valuable discovery for relieving pain and suffering in humanity," it was announced by Mount Sinai on April 11

The medal was presented on April 12 at Leeds, England, in absentia, by the Lord Mayor of Leeds, as Dr Schick was unable to go abroad for the ceremonies The medalist was selected by the dean and others of the Faculty of Medicine of Leeds University

While the award is scheduled to be given annually, this is the first time it has been given since 1935 The last recipient was Sir Henry Dale of London co-winner with Professor Otto Loewi of Vienna of the Nobel Prize in Medicine and Physiology in 1936 for his pioneer discoveries of the chemical activity of nerve impulses

Dr Schick received the gold medal of the New York Academy of Medicine on March 3 at special ceremonies commemorating the twenty-fifth anniversary of the announcement of the Schick test The British and American honors were conferred independently

THE CONCLUDING LECTURE on "The Art and Romance of Medicine" at the New York Academy will be given on May 26, at 8 15 P M on "X-Ray within the Memory of Man," by Lewis Gregory Cole, M D, consulting Roentgenologist, Fifth Avenue Hospital

Niagara County

A SPECIAL COMMITTEE of five physicians to make a thorough survey of the medical needs in the county was appointed by Dr Vincent Leone, president, at the monthly meeting of the County Medical society on April 12

Dr Grant Guillemont was appointed chairman of the committee Other members are Drs Oscar Baer, George Stoll, Wilfrid Anna, and Julius T Markowitz

The committee will cooperate with the American Medical association which recently recommended that the medical societies of each county take steps to determine whether there is a satisfactory balance between the medical needs or demands and the medical services supplied One of the main objectives will be to find whether adequate medical services are available to the indigent and the low-income group

Dr E Perry McCullough, Cleveland, was guest speaker at the meeting

Onondaga County

BETWEEN 400 AND 500 representatives of Syracuse's civic, religious and professional life gathered in the Onondaga hotel on April 5 to pay tribute to Dr H Burton Doust, commissioner of health, on the thirtieth anniversary of the establishment of the first upstate municipal tuberculosis clinic

Dr J Arthur Myers of Minneapolis, professor of medicine at the University of Minnesota, and president of the National Tuberculosis Association, was principal speaker at the luncheon He paid tribute to Dr Doust and the health facilities of Syracuse when he said

During the thirty years that Dr Doust has been in charge of the clinic, more has been accomplished by way of controlling tuberculosis than in all of the centuries past

We now have all the information that is necessary in order to bring tuberculosis under control, that is to reduce it to a disease of minor significance, as has been done with typhoid fever and diphtheria

Every phase of tuberculosis control work that has been found of value is being carried on in Syracuse and vicinity From now on it is simply a matter of intensifying the programs

J F Sabine Meachem vice president of the Onondaga Health Association, which sponsored the luncheon, presided at the program, and brief addresses were given by Mayor Rolland B Marvin, Dr William A Groat, president-elect of the New York State Medical Society, George J Nelbach, secretary of the New York State tuberculosis committee, New York City, and Dr Doust

It was on April 2, 1908, that Dr Doust opened the present Syracuse chest clinic in the former Jaloneck homestead, 508 E Fayette street

Queens County

AN ADDRESS WAS GIVEN at the meeting of the Medical Society of the County of Queens on April 26 on "Some Prostatic Problems, Including Prostates in Females"—with motion picture in color "Genital and Adrenal Operations in Hermaphrodites"—by Hugh Young, M D, of Johns Hopkins Hospital, with discussion by Drs Benjamin Derrah, Francis Riley and Elias Rubin

On May 31 at 8 30 P M, the regular stated meeting will be devoted to Forensic Medical subjects This will be a joint meeting of the Society and the Queens County Bar Association

AN OPEN MEETING of the Queensboro Surgical Society was held on April 28 at the County Medical Society building The guest speaker was John E Jennings, M D, F A C S His subject was "Modern Management of Cancer of the Breast"

A JOINT MEETING of the Medical Society of the County of Queens, Inc, and the Dental Societies of Queens was held on May 4 at the Medical Society's building Subject "Interesting Phases of Oral Surgery of Importance to the Medical and Dental Practitioner" 1 Oral Infections 2 Neoplasms, 3 Maxillary sinus complications, 4 Cleft palate, 5 Cooperation of general surgeon and oral surgeon in injuries of the jaws Essayist Henry Sage Dunning B S M D, D D S, F.A C S Professor of Oral Surgery Columbia University Subject "Procedures and Results in Plastic Surgery," illustrated with motion picture and slides essayist Gustave Aufricht, M D, Associate Professor Clinical Surgery, Post-Graduate Medical School of Columbia University

Rensselaer County

DR. DONALD G BUCHANAN, who died in Troy Feb 22 left a gross estate of $48,-101 82, according to inheritance tax report filed on April 12 by Transfer Tax Examiner Thomas F Phelan in Rensselaer County Surrogate's Court. There are deductions allowed by law of $1,926 37

St. Lawrence County

FORTY PHYSICIANS were present at the lecture given by Dr K. R McAlpin before the St Lawrence County Medical Society at the Hepburn hospital auditorium in Ogdensburg on April 14 The lecture was preceded by a luncheon at the Crescent Hotel Dr McAlpin spoke on "The Modern Treatment of Anemias"

WELFARE COMMISSIONER Charles S Hubbard was notified by the Ogdensburg Medical Society on April 14 that in the future fees for welfare obstetrical cases would be $25, an increase of $10 It was learned, however, that $10 of the fee was for prenatal care

Mayor John J Livingston, when he learned of the increase in fee, hinted that the Welfare Board might seek the services of a physician who would give all of his time to relief cases Under previous fees physicians were caring for obstetrical cases at $15 and at the same time assuming pre-natal care

Saratoga County

SARATOGA COUNTY PARTICIPATION in the nationwide syphilis control movement was furthered at a community meeting on April 7 in Skidmore College Hall under the auspices of the Saratoga County Medical Society and its auxiliary

Dr Walter S McClellan, president of the society, presided and Dr Charles R. Rein, dermatologist and syphilologist at the postgraduate medical school and hospital, Columbia University, spoke on "Syphilis—Public Health Enemy No 1"

Participating in the discussion were Assemblyman Richard J Sherman of Troy, Rev Charles C Noble, pastor of Christ Methodist Church, Glens Falls, and Dr William A Brumfield, jr, director of the division of syphilis control of the State Health Department.

Suffolk County

DR ALBERT F BARRY, a member of the staff of the Brunswick Hospital, Amityville, for ten years, was honored on March 31 at a dinner at LaGrange Inn, West Islip, attended by sixty-five doctors and friends in celebration of the completion of fifty years of practice in medicine

DR. WILLIAM A HULSE, retired physician, former vice-president of the South Side Bank of Bay Shore, died on April 8 at his home after an illness of three years He was seventy-nine.

Westchester County

THE PUBLIC HEALTH COMMITTEE of the Medical Society of the County of Westchester points out in a resolution that school authorities are led to encourage the attendance of children having minor non-disabling contagious physical conditions because state funds are allotted to the schools on the basis of daily attendance The resolution states that "the consequences of children being in school who are afflicted with these conditions, principally of the respiratory tract, are dangerous from the standpoint of public health both for the child afflicted and for his school mates"

Enrollment as a basis for allotments is suggested

Dr Ralph Pemberton, of Philadelphia, professor of medicine at the Graduate School of Jefferson Medical College, was guest speaker at the meeting of the society on April 19, on the topic of arthritis

Arrangement of two more post-graduate "refresher" sessions was announced. "Gonorrhea in the male" was the topic at Grasslands Hospital, April 27 A "refresher" session is to be presented on May 24 at Mount Vernon Hospital by the special commission of maternal welfare under the chairmanship of Dr Julian Hawthorne This session will be devoted to "modern obstetrical practice."

The Public Health Committee is cooperating with PTA units in the annual "Summer Round-up" of pre-school children The purpose is to make certain every child about to enter school for the first time in the Fall shall have a physical examination and remediable defects attended to before school opens

DR WALTER SPENCER FLEMING, a practicing physician since 1892, died on April 5 at his home, of coronary thrombosis He was seventy-five

Dr Fleming was highly esteemed by the thousands of persons with whom he was associated during his long medical career, says the *Mount Vernon Argus*

In 1933 he was honored when a bronze tablet inscribed with the quotation "He gave of himself freely," was hung at Mount Vernon Hospital

In conjunction with the tablet dedication a dinner was given for him at the Westchester Country Club, under the sponsorship of the Mount Vernon Medical Society, of which he was a charter member

Prominent figures in the world of medicine and surgery, public officials and members of the clergy turned out by the hundreds to pay their tribute to a man who placed service above everything

Hospital News

Newspaper Story of a Hospital Operation

THE PUBLIC FORM THEIR IDEAS largely on what they read in the newspapers, and the newspaper stories are lurid and distorted so often that it is refreshing to find one that clearly inspires public confidence in the hospitals and in the skillful work of the physicians and surgeons there. True, it is not at all the cool, scientific account that would appear in another part of this journal, but it is given here as a slice of today's newspaper writing—and, after all, it has a real story behind it We may say if we like that the color is laid on the canvas in chunks, but don't Mr and Mrs John Public like it that way? It is in the New York *Evening Journal* of April 13, the writer is John Harrington, and it is captioned in big type "Doctor Takes Out Heart of Officer—Amazing Feat—Patient on Way to Recovery" It runs like this

Patrolman William Manning was practically dead when they got him on the operating table at Fordham Hospital

He had no pulse at all His body was already cold. His heart was just a feeble flicker In five minutes it would go out altogether

He had been almost as bad when they brought him into the hospital a few minutes before

The knife had gone deep in his chest, then twisted, cutting off a part of his lung, and the back of the knife had scraped his heart

Dr Alexander Nicoll, director of surgery, looked at him and said

"I've been waiting for years for this Get him on the table!'

They had him on the operating table in two minutes The room was filling fast with doctors For word had flashed through the hospital that Dr Nicoll was going to do a pericardiorrhaphy

He was going to take out a man's heart and see what was wrong with it

In his thirty odd years of surgery he'd never seen it done Nobody in the hospital had ever seen it done. It was one of those things worked out on surgical blueprints—one of those things that science said could be done

Gets Lucky Break

But nobody had seen it done because, when a man needs an operation like that, he's five minutes from death

And, unless there's a surgeon standing right there, unless there is an anesthetist and an operating room, it's all over But Manning had been lucky The surgery director had studied that operation from charts

So there were fifty people or more in the operating room when Dr Nicoll made the sweeping incision, from the side to the breastbone, and along the breastbone for eight inches

"Rib shears," he called, dropping his knife.

The shears were in his hand He cut through the third, fourth, fifth and sixth ribs at the sternum

"Rib retractor!"

He clasped the shiny steel hooks onto the severed ribs A trapdoor, a big trapdoor, opened in Manning's chest

The left lung was collapsed, the cavity filled with blood That was one of the reasons the heart was stopping—but not the only reason

Picks Up the Heart

While the humming little apparatus, a glorified little vacuum cleaner, sucked up the blood, Dr Nicoll, reached down and picked up the heart He could see then what was wrong with it—the pericardium—the membranous sac covering the heart, was battered and bruised

There was a big lump in it where blood had collected—blood that was pressing on the heart and stopping it, blood that was killing the man on the table.

Dr Nicoll slit through the sac, through the outer covering of the heart, and the blood dripped out.

Instantly that feeble, fluttering organ became a leaping, pulsing thing in Dr Nicoll's hands

"Like a fish out of water," explained a doctor who saw it all "Once that pressure was relieved, it was almost impossible to hold it. But Dr Nicoll had handled hearts before He knew how"

Patient Sewed Up

Dr Nicoll was sewing up the slit pericardium now Eight stitches and it was not quite closed. There was still a small opening There had to be—for there would still be bleeding inside the heart, and closed up tight the blood pool and the pressure would soon occur again.

The surgeon took a little silver tube and fitted the end in that little pericardium opening The other end protruded from the breast, alongside the breastbone The rib retractor came out, the ribs fell back into place, and the stitches held it there

Before the last stitch was in place, the blood donor was standing beside the table. Manning needed it His heart was all right now, but he had lost most of his blood. He got a pint of a fellow patrolman's blood before he was off the table.

This happened seven days ago

Today the tube was out of Manning's chest Nicoll took it out and asked him how he felt.

"No complaints, doc. No complaints at all."

"Wanted—A Code for Trustees"

HOSPITAL TRUSTEES LIVE IN a sort of "Twilight zone," no one seems to know exactly where their powers begin or where they end This misty, not to say murky, state of atmosphere is apt to lead to collisions, or at least brushes, of rival claims of authority and charges of blame for this and that A code is needed to clear the air and show everybody where he stands, thinks the *Modern Hospital*

Executives and their superiors, the members of the governing board, do not always agree on the cause for unsatisfactory hospital conditions Trustees are wont to claim that it is necessary for them to administer because the superintendent is ineffective The superintendent is inclined to state that boards of directors meddle because their members do not recognize the duties or possess the requisites for good hospital trustees

The fact remains that hospital executives are inclined either to genuflect too much or else to look with pitying gaze upon their trustees as persons wholly uninformed as to the methods of conducting a hospital On the other hand, if executives are inclined to be positive in their attitude toward administrative problems, they are sometimes considered as defiant or insubordinate A search for a middle ground upon which each may meet and understand the other is often unsuccessful The result is an impassé, which results in the administrator seeking other fields in which to labor

Would it not be possible for a code of relationships to be so thoughtfully conceived and so concisely set down, that it might serve as a document to guide boards and administrators and thus avoid harmful misunderstandings? It could cover such matters as a definition of the policy-making activity of the board as distinguished from the administrative function of the superintendent, the relationship of board committees to the executive and to the board as a whole, the deprecation of surprise visits by inspecting committees, and the procedure regarding the origination and routing of orders When left uncertain these matters serve to agitate the calm waters of everyday hospital living

If no other purposes were served than properly to place women's committees within the organization, to decide the method of expenditure of funds coming into their hands, to arrange for the audit of these funds and to fix the relationship of such a group to the nursing staff and to the patient, it would be well worth while.

Too long have good administrators been distressed by attempts to obtain from board committees a proper evaluation of reports as to unclean linen, floors and walls, foreign bodies in food, petty complaints of patients and matters of like ilk. The answer appears to lie in the formation and general adoption of a code of professional and administrative relationships, written in a cool, straight-forward manner, fraught with common sense and yet wholly devoid of personalities

A Parents and Nurses' Association

AN INTERESTING AND FRUITFUL plan is in operation at the St Joseph Hospital School of Nursing at Fort Wayne, Ind, where a Parent-Nurse Association has been formed and is "functioning effectively," according to reports from there It has brought "such a wealth of social and financial benefit" that inquiries about it are coming in from every direction The idea "came almost overnight," we are told in *Hospital Progress*

It all began with inviting mothers and fathers of the students to be chaperons at a dance They came, enjoyed the evening, and were determined, as the ensuing days showed, to become more interested in not only such evenings, but in all the social and recreational affairs of their daughters Right then and there, it was suggested that all parents in the city and environs should be contacted and asked if they would be interested in forming a club, one to sponsor the new-born idea Letters were sent to every parent and the response was most gratifying Many attended the first meeting, plans were made for an organization, officers were elected and meetings have been held bimonthly ever since. Now we have many out-of-town members sending their contributions whenever they are unable to attend functions The membership fee is $1 a year for each family and the money is used for the nursing school and its students only The Organization is so active now that the people of Fort Wayne in general are becoming interested enough to

attend public parties and helping in many ways, by donating their halls, giving prizes for games, etc.

Through the ever-progressive efforts of the superintendent (mother of all the students) who is the secretary of the Association, a precedent was established in the fostering of a Christmas Party for Nurses and Parents It was a very enjoyable event, elaborate in preparation, and set forth more than ever the conviction that the Parent Nurses' Association isn't only a "hapstance" organization, but a necessary asset to the good-will and fellowship of the students, for their happiness and pleasure and to the school, materially We wonder now what we ever did before this organization began!

To show how much the Parent Nurses' Association really has done in the course of one year, we wish to point out these major benefits, a talking moving picture machine has been purchased, new furnishings have been added to the nurses' home, a ping-pong table has been built—all this from the proceeds derived from roller-skating parties, bridges, teas, bingo evenings, and dances These entertainments are all free of charge to the nurse and add to her recreation It is the interested public who have helped through the efforts of the mothers and fathers

Newsy Notes

THE ANNUAL CONVENTION of the Hospital Association of New York State will be held in Buffalo on May 18, 19 and 20, attracting hospital superintendents, trustees and others of the hospital fraternity from all parts of the state

The State Association of Medical Board Librarians and of Nurse Anesthetists will meet concurrently with the Hospital Association and join in the discussion of common problems

Skits on current topics are being arranged, together with roundtable discussions and officers' reports

Included among guest speakers will be L A Harding, former professor of engineering at Lehigh University and Commissioner of Public Works in Buffalo, who will discuss "Power Plant Problems" in connection with hospitals Other guests will speak in connection with material questions in hospital operation

Many of the discussions will deal with "bones of contention" that have affected public relations These will include "Why internes should not be paid", "Should nurses pay for their education?", "The meaning of the New Nurse Practice Act," and "Public Relations of a hospital in a small community"

NEW YORK'S THREE-CENTS-A-DAY hospitalization plan received the official stamp of approval on April 18 of the American Hospital Association, which represents 7,000 hospitals in the United States and Canada At the same time "Approval Day" ceremonies were held in thirty-nine other cities throughout the country at which similar plans were approved

It was the first time that the association had officially designated the non-profit hospital service plans which met its approval The forty approved plans, scattered through nineteen States and the District of Columbia, have a combined membership of more than 1,600,000 More than half the members are residents of New York State and 41 3 per cent are members of the Associated Hospital Service of New York.

There are in addition about thirty-five single hospital plans and others not officially approved by the Association which have a total enrollment of 200,000

The certificate of approval was presented to Karl Eilers, president of the Associated Hospital Service, at a luncheon in the Hotel Commodore attended by more than 300 public health officers, hospital administrators, doctors and business executives, at which Frank Van Dyk, executive director of the service, announced that 99 9 per cent of all hospital admissions of subscribers who sought benefits under the plan received full approval

"Approval Day" ceremonies were held in eight other cities in New York State where the hospital plans have been approved They are Albany, Buffalo, Geneva, Jamestown, Rochester, Syracuse, Utica and Watertown Their plans have more than 200,000 members

Subscribers to the three-cents-a-day hospital plan of the Associated Hospital Service of New York, will receive increased benefits, it is announced by Frank Van Dyk, executive director

Under the new policy, thirty days of semi-private hospital care will be provided instead of twenty-one, and the subscribers will re-

ceive a 33⅓ per cent discount off semi-private hospital charges after thirty days instead of the former twenty-five per cent discount after twenty-one days All present and future subscribers will benefit by these changes

THE HOSPITAL NUMBER OF THE *Journal of the American Medical Association* reports occupancy in American hospitals last year at the highest figure ever recorded by the association Every important category of hospital showed an increase in use

This growth in occupancy is uneven Certain communities still have more than ample provision for the care of bed patients while others have found their overcrowding almost unbearable An excess of beds 100 or more miles away is of little value to the hospital that finds the demand in its own community greater than its facilities

As pointed out in the statement by the technical committee on medical care, there is now a deficiency of about 400,000 hospital beds according to present standards "Measures to fill this need would include the construction of at least 500 hospitals of from thirty to sixty-bed capacity in rural and sparsely settled regions that have inadequate hospital facilities," the committee states

FLUSHING HOSPITAL RECEIVES $10,000 under the will of Marie Louise Williams, who died in January

SEVEN HUNDRED PERSONS including Nassau county officials and leaders in the medical profession will honor George L Hubbell of Garden City for his more than a quarter century of service in promotion of public health in the county at a testimonial dinner to be given at the Garden City hotel May 25

The dinner will particularly mark Mr Hubbell's twentieth year as president of the board of managers of Nassau County Tuberculosis hospital at Farmingdale It is sponsored by the Plainview club, composed principally of employees of the hospital Speakers will represent the county government and other groups in which Mr Hubbell has been interested Attendance will be limited to 700

Mr Hubbell was a moving force in founding the original Nassau County sanatorium in the days when little recognition was given the need for public health service Under his direction as president of the board of managers, the institution has grown in twenty years to nine large buildings housing 430 patients, a competent staff of physicians specializing in tuberculosis treatment, and the most modern equipment known to medical science His service has been given without financial compensation

In addition to his work at the tuberculosis hospital, Mr Hubbell is president of the board of managers of Meadowbrook hospital, general county hospital He was an energetic worker in the campaign that preceded authorization of funds for the hospital, now recognized as one of the county's greatest assets

Improvements

THE NEW $284,000 PLANT of the Homestead Sanitarium, the Saratoga County tuberculosis hospital, was officially opened on April 11

This new sanitarium has been under construction for the last year and a half and now is complete The building alone cost $250,000 and the furniture and equipment an additional $34,000

The hospital is situated about twelve miles west of Saratoga Springs about three miles north of the main highway from the Spa to Gloversville

The building is beautifully situated in the foothills of the Adirondacks and from the windows of the second story the State Office Building at Albany may be seen, forty miles away

The sanitarium will accommodate one hundred patients Each room is painted and decorated differently from all the others There are no wards, rooms being for one or two patients

Dr Asa R. Dimock is the superintendent and has had charge of the plans for the erection of the new building

NIAGARA FALLS CITY AUTHORITIES are preparing plans for extensive improvements to the municipal hospital The project, which proposes alterations to the existing hospital building and an addition to increase its capacity by about twenty beds, is being prepared for submission to the Works Progress Administration at the present time City Manager Robbins said, however, that it would probably be set up for submission to

the Public Work Administration should it be revived, since the city's share of the cost of the work would be smaller under that agency

Estimates made in preparing the project for submission to the WPA set the total cost at between $100,000 and $115,000 The city's share under the WPA would be between $65,000 and $70,000, while under the PWA forty-five per cent grant plan it would run less than $60,000

•

WORK ON THE NEW addition and alterations to the Lockport City hospital, which is a Public Works Administration project, is rapidly nearing completion, L W Van Ore, resident P W A. engineer, announced on April 14

According to the terms of the contract, the building was to have been ready by Jan 30, but a three-month extension was granted by the P W A Mr Van Ore said the project is now about seventy-two per cent completed

The third floor addition to the west wing, which contains additional private rooms and wards, has been in service about five months

•

WHEN MAYOR E H ETHRIDGE, of Rome, saw in the morning paper that more money might be available for PWA work, he wrote at once to Mr E Gilmore, New York, regional PWA director, for a slice of it to help build a city hospital He said

In this morning's paper I noted that there would undoubtedly be a large appropriation made in Washington to resume certain PWA projects

The hospital situation in Rome is most unsatisfactory and in fact in my opinion, it is practically an emergency, as the patients are so crowded at times in our hospital it is necessary to have some of the patients occupy beds placed in the hallways

The original hospital building was built in 1888 and since that time many additions have been added and the present hospital is not fireproof in any sense of the word.

If there is any possibility of the City of Rome securing federal funds for such a project, we are most anxious to take advantage of the same.

Possibly this letter is a little premature, but we wish to leave no stone unturned to secure federal funds, if there is a possibility of securing such funds in the near future.

•

SEALED PROPOSALS covering construction, heating, sanitary, electrical, refrigeration and other work on the $450,000 hospital building at the New York State Institute for the Study of Malignant Diseases, in Buffalo, were opened at the state department of health, Albany, on April 14, and it is expected that contracts will be awarded and construction will begin at an early date

COMPLETED PLANS FOR THE new White Plains Hospital building are in the hands of the various contractors for bids The date for breaking ground has not yet been set

A SURGICAL INSTRUMENT ROOM at the Staten Island Hospital has been named "The Dr Alfred H Thomas Room" and a fund has been raised, the income to go for the purchase of surgical instruments

WELLSVILLE'S MUNICIPALLY-OPERATED Jones Memorial hospital now has an addition long-sought as necessary adjunct to the institution which in 1937 admitted 1,365 patients—virtually one-fourth of the population of the village.

The addition is a well-equipped laboratory in the basement of Tullar Maternity annex in charge of a trained technician

Our medical staff has been handicapped for a long period of years by the lack of laboratory facilities at the hospital," says Alwin W Schaller, chairman of the hospital board of managers "We now feel we have made an important and essential addition to our equipment and one which will certainly prove its worth We should have had it long ago"

The hospital and Wellsville doctors in the past have been obliged to use the county laboratory at Belmont, which in emergency cases has involved loss of valuable time

With the enthusiastic endorsement of physicians, a plan was evolved in cooperation with Eugene Brace, medical technologist, of Mayville, whereby a laboratory could be provided Under the arrangement, the hospital provides quarters for the laboratory, furnishing light, heat, water, plumbing, work benches and cabinets, while Mr Brace, the laboratory technician, supplies all of the lab equipment and supplies All fees for both in and outpatients go to the technician

LITTLE is the Cost *GREAT* is the Satisfaction

THE NEW YORK PHYSICIANS' MUTUAL AID ASSOCIATION

(Organized June 27, 1868)

OBJECTS

(1) To pay death benefits to the estate of deceased members or to designated beneficiaries

(2) To furnish pecuniary aid to members in cases of urgent need

A means for gratifying a natural wish of every physician,—certain provision ($1,000 00 paid immediately after your death) for emergency expenses

Physician's Contract Restricting Practice

Recently a final judgment was directed by the Appellate Division of the Supreme Court in favor of a physician in a case of considerable interest which has been working its way through the Courts of this State for many months *

The plaintiffs in the action, Drs A and B were engaged in practice as copartners, and conducted a so-called medical center and clinic in and about the Village of Y They brought an action in equity against Dr C who was also engaged in the practice of medicine seeking a perpetual injunction under the terms of a written contract by virtue of which Dr C had been employed by them

The complaint charged that the plaintiffs had spent large sums of money setting up their practice, having purchased a building, remodelled and equipped it. They claimed that they had employed the defendant beginning in December 1932, and that he had worked with them under his contract until August 1935, when he quit During that period he was paid various sums of money as wages and bonus Subsequent to August 1935, plaintiffs complained Dr C had continued to practice in the County of Y (in which Drs A and B conducted their practice) without their written consent. Dr C, it seems, did not live in Y County prior to his employment by the plaintiffs, and they contended that his conduct in setting up a competing business violated the contract, injured their property rights and destroyed the value of their good will

The complaint further alleged that the contract of employment provided among other things that Dr C would never engage in the practice of his profession in the County of Y, except in the employ of or in association with the group headed by Drs A and B unless the plaintiffs gave consent in writing It was charged that the contract stipulated that in the event of a breach of the covenant by Dr C he should pay the sum of $10,000, as liquidated damages, and not as a penalty

The defendant, Dr C, applied by motion at Special Term for judgment dismissing the complaint on the grounds that it did not state facts sufficient to constitute a cause of action It was argued by defendant that the agreement was void as against public policy and that its enforcement was unreasonable, harsh, and oppressive

The Court at Special Term dismissed the complaint, but plaintiffs appealed to the Appellate Division That Court determined that the complaint was on its face valid and reversed the order of the lower Court ** In so ruling the Court said in the opinion

> It is fundamental that the test to be applied in cases of this sort is, first, is the injunction proposed necessary and reasonable for the protection of the plaintiff's property and good will, and second, is it unreasonable, unjust or oppressive to defendant?
>
> In the ordinary employment equity will not restrain a breach of a covenant for personal services unless the services are of peculiar merit or character This principle is without application in a suit to restrain an employee from violating an agreement not to engage in the same line of business, either for himself or in behalf of, or in conjunction with, others, after his employment under the contract containing such restrictive covenant has been terminated In the one case it is the damage suffered by the loss of the services of the exceptionally skilled employee, in the other it is the damage to the employer's business by the setting up of a competitive business by a former employee.
>
> Agreements imposing restraints upon the right of an employee to engage in competitive service after the termination of the contract of service are analogous to and governed by, the same general rules applicable to restrictive covenants in the sales of business and good will The dictates of fair dealing, and the requirements of good faith, will at once engage equity whatever may be the relationship of the parties or the nature of the transaction, where fraud or dishonesty threaten unlawful or irreparable injury to the property of a suitor
>
> It is manifest that the physician employed as an assistant to another must in the course of his duties become acquainted with the clientele of his employer and acquire their confidence and good will. It is clear that this precise situation was contemplated by the parties to this contract, and that it was drawn to provide against the business and good will of the plaintiffs being lost to them in case of the severance of the

*Foster v White, 248 App Div 451

**253 App Div 448

employment, and defendant's locating in Y county Defendant's establishing himself in Y county for the practice of medicine was a deliberate choice on his part to disregard and violate his solemn bond not to compete with his former employers In such circumstances courts of equity will extend the arm of injunction where the interests of justice require such a drastic remedy for the protection of a physician's business, practice and good will

Following that ruling the defendant, Dr C, carried to Court of Appeals, a so-called certified question, as follows

"Does the complaint state facts sufficient to constitute a cause of action?"

The Court of Appeals answered that question in the affirmative and affirmed the order of the Appellate Division, but wrote no formal opinion ***

The controversy then was in the position that it went back to the Trial Court for disposition After a hearing before a referee the plaintiffs obtained their desired perpetual injunction preventing Dr C from ever practicing medicine in Y County But at this point Dr C carried the case again to the Appellate Division and succeeded in obtaining a reversal of the judgment granting the injunction

It appeared upon the hearing of the appeal that the proof before the referee had led to the conclusion that defendant had performed services satisfactorily under the contract, and that instead of quitting his contract or voluntarily leaving Drs A and B, he had been discharged from their employment by the plaintiffs, merely for the reason that he refused to execute a new contract requested by them It also appeared that the contract when made called for employment for a year "at a weekly salary of not less than fifteen dollars" No other written contract was ever entered into but the employment continued until August 1935 with salary increases and bonuses paid to Dr C from time to time The proof was susceptible of the interpretation that the written agreement of December 1932, was "by consent of the parties carried over, extended and continued" until August 1935

The Appellate Division in reversing the judgment, and ordering the dismissal of the complaint made a specific finding that the defendant had been discharged for an insufficient and invalid reason, and said in its opinion

The acquiescence of the parties here in operating year after year under the 1932 contract is equivalent to an express agreement to a continuance, or renewal from year to year, of the original contract

Plaintiffs having discharged defendant for no reason other than that he refused to enter into a different contract with them, one which he did not like, are in no position to seek the aid of equity to enforce what seems like a harsh provision of the contract. For, if we take the view which plaintiffs urge in their brief, that the contract of December, 1932, was never renewed, that no contract between the parties existed after December 31, 1933, that thereafter defendant's employment continued merely by sufferance of the plaintiffs, then the contract was an exceedingly harsh one, by which, for the salary of fifteen dollars a week, for a period of one year, defendant has sold his right ever to practice his profession within the county where his entire professional life has been spent. We prefer the view that plaintiffs by terminating defendant's employment for an improper reason have deprived themselves of the aid of equity

It is not possible to say as yet whether this judgment of dismissal may not again be taken up to the Court of Appeals However, the last ruling in no way affects the importance of the earlier decision The ruling still stands that the complaint stated facts which if proved constituted grounds for injunction The last decision constitutes a ruling that the plaintiffs failed to support their charges when the actual proof was brought forth

Alleged Injury Caused By X-Ray Machine

A young man who had received an injury to his ankle in falling from a moving car, consulted a physician with respect to that condition and an x-ray was promptly suggested The doctor requested another physician, with whom he was associated, to take the necessary x-rays The patient was placed on a table in proper position and just as the current was turned on the patient moved his other leg touching the metal wheel of the table and caused a short circuit. The patient fell or jumped from the table striking the floor Upon examination, made by both physicians, it was found that he had a small superficial burn on his right knee and a similar one on his left calf The burns were treated the same day and the patient was told to return for observation and further treatment if necessary The patient, however, never returned

Sometime later he brought an action against both of the physicians in which he made the claim that during the course of the taking of x-rays there was an explosion causing him to suffer severe injuries

The case came on for trial without a jury and the defendants denied that the alleged explosion ever took place and explained what had happened At the conclusion of all the testimony judgment was directed in favor of the defendants

Across the Desk

Ignorance that Kills

'How do babies come, mothaw ?"

'Hush, my dawling, the nice doctor-man brings them in his little black satchel"

But the "little dawling" has heard a different story from her playmates, and she keeps on acquiring so much information and misinformation, hopelessly mixed, that when her own time comes, the doctor-man faces a bad and perhaps tragic problem The mother missed a golden opportunity This was forcibly put a few days ago by Dr Howard W Haggard, of Yale "I believe,' he declared, "that the parent—or the educator—who does not teach the child the knowledge of maternity is reprehensible And I believe further that those individuals who stand in the way, either by indifference or by active opposition, of the full dissemination of such information bear a heavy responsibility—the responsibility for the ignorance that breeds the indifference, that leads to the loss of life."

Hope Dispelling Pessimism

Dr Haggard was speaking to some 400 doctors, health workers and civic leaders at the eighth annual Mother's Day luncheon of the Maternity Center Association at the Hotel Park Lane, in New York City He confessed that he had mistakenly thought eight or ten years ago that if the facts and figures about safe maternity were brought before the American people, a change in the maternal death rate would appear at once, that "old prejudice would crumble away, that the ignorance that fathered indifference would be dispelled, that children would be educated for parenthood, and that mothers would be protected and saved"

But this did not happen Maternal mortality in these years has declined "pitifully little," and "the results, as judged from the figures, are discouraging" Many have felt a certain hopelessness, but despite all gloomy statistics, there is good ground for optimism, "soundly based," believes the Yale physiologist Ignorance and indifference are disappearing and public opinion is arousing in a remarkable way Indeed

Customs are changing with a rapidity that is amazing And the change that breaks down old prejudices, old pruderies, that makes us a people more willing to face facts frankly, is the initial step toward the results you seek There is, unquestionably, a growing but tardy realization in this country that there can be no wrong in any fact honestly, sincerely, and fearlessly presented What I call the cult of cultivated ignorance, evasion of facts, is, I think, now fortunately doomed in this country, it will give way to the freedom of knowledge, it will pass when the older generation is replaced by the younger, a more fearless—a franker—essentially a better generation And that younger generation is solving its problems for itself with, unfortunately, little aid from those of the older generation

The Change in Eight Years

Only eight years back Dr Haggard was actually refused permission on the radio to say simply that measurement of the pelvis by the physician was an essential prenatal procedure. The word "pelvis" was believed to be offensive to the public Now the situation is fast changing

Our newspapers, our magazines—even our pictorial magazines—are discussing with utmost frankness matters considered completely unmentionable only two or three years ago The prohibitions of the radio are relaxing Moving pictures even are appearing to tell the facts of safe maternity In an increasing number of cities fathers classes are being formed where with medical lectures and demonstrations expectant fathers can learn the requirements of the new safe maternity

We all remember the hubbub raised a few years ago when reports revealed that maternal mortality in this state was rising, instead of falling The number of puerperal deaths per thousand live births rose from 5 6 in 1929 to 6 2 in 1933, and everybody began asking who or what was to blame Rather heated language, perhaps, was used here and there, but it was all in the best of causes, and the result was apparently also all to the good, for figures just out in *Public Health Reports* (April 22) show that the rate has dropped to 4 9 in 1936, the latest year given This is excellent, and would warrant a lot of self-congratulation if the eye did not

wander along the table and note that our neighbor states are doing quite a bit better than we are New Jersey, for instance, has brought its rate down from 6 3 in 1927 to 4 0 in 1936, and Connecticut, on the other side, has had for years a lower rate than New York, and appears with 4 1 for 1936 Fifteen states have rates lower than ours So there is still room for improvement

Home Thrust at the Young Doctors

The importance of this matter "leaps to the eye," as the British say, when we remember that every fourteen seconds on the average, in this country, a baby is born Another speaker at the Maternity Center luncheon, who evidently had been eating with one eye on his wrist-watch, announced that "while we were eating our lunch today there were about 250 babies born in the United States' He was Dr Edwin F Daily, of the U S Children's Bureau at Washington, and his address was naturally in part a plea for more funds for his bureau, to help extend their service to mothers and babies Of more interest here, however, is his statement that the young doctors of today are not fully prepared to treat the emergencies likely to arise in obstetrical cases He declared (italics in press report)

With a medical profession in the United States generally acknowledged throughout the world as second to none, it would hardly seem necessary to question the quality of medical care available to maternity patients *Yet there are serious doubts that the average physician in the United States has sufficient training to practice obstetrics* I recently received answers to certain questions about their training in obstetrics from over 2,500 young physicians who graduated in 1936 and who had completed their intern year As students, twenty per cent had never delivered a patient in a hospital, and twenty-six per cent had never delivered a patient at home. As interns, fifteen per cent had not delivered a patient in a hospital, and eighty-three per cent had never delivered a patient at home. Yet seventy-two per cent of these doctors stated that they planned to include obstetrics in their practice There are relatively few places in the United States where these physicians can receive further training and experience in obstetrics Obviously few physicians entering practice today have sufficient clinical training in obstetrics to recognize and treat competently the many complications which may arise during pregnancy and labor Numerous maternal mortality studies have shown that lack of judgment or experience on the part of the physician is one of the major factors in maintaining the high maternal death rate. *It is the obstetric education and training provided by medical schools and hospitals that should receive the major blame, for certainly doctors provide their patients with the best possible service within the limits of their ability*

"Picayune Minds"

Echoes of old-time conservatism appear in the ban of the movie censors on the "Birth of a Baby," and the prohibition of the sale of the magazine carrying scenes from it in some communities A forthright editorial on such attempts to blindfold the eyes of the public is published in the *Bulletin* of the Medical Society of the County of Queens, written by the Editor, Dr Ezra A Wolff It reads

It was recently the privilege of this Society to present a preview of the film "The Birth of a Baby" to an audience composed of the families of physicians The film is educational in purpose and depicts the conduct of a normal pregnancy and labor, including details of prenatal care as well as those of the actual delivery A poll of those who had seen the picture showed that upward of ninety per cent were favorably impressed and thought it in no way obscene or objectionable

A wide storm of protest has followed the publication in *Life*, the weekly picture magazine, *of a pictorial synopsis of this same picture.* Local officials in a considerable number of communities have banned the sale of this issue, a number of newsdealers have been arrested for displaying it, and demands have been made to have it barred from the mails as "lewd" and "disgraceful"

During the past year or so we have witnessed the inauguration of another educational campaign—the drive against syphilis Here again, there were cries of 'lewd," "obscene," "disgraceful" Today the syphilis problem is accepted at face value by the vast majority of *the population From an ultra-conservative viewpoint* it might be premature at this time to deny categorically that this campaign has caused an increase in immorality, yet it is safe to assert that there are few who would maintain that such an increase has occurred or will occur

It is hardly a flattering commentary on this "enlightened" age that the reins of government are placed in the hands of people who can attribute any possible immoral significance to a clear and straightforward exposition of the process of procreation Factual knowledge concerning a mechanism which affects every being on the face of the earth can be construed as immoral only in picayune minds of those who would cloak morality in a veil of mystery and ignorance.

Fractures and Dislocations Volumes I & II by Philip Lewin, M D Edited by Morris Fishbein, M D (National Medical Monographs) Duodecimo of 698 pages, illustrated New York, National Medical Book Co, Inc, 1937 Cloth, $6 00

REVIEWED

Essentials of Prescription Writing By Cary Eggleston, M D Sixth Edition, Revised 16mo of 155 pages Philadelphia, W B Saunders Company, 1938 Cloth, $1 50

The sixth edition of this pocket-sized handbook of practical prescription writing is not vastly different from its predecessors It contains a great deal of helpful information for the general practitioner who wishes to use a variety of tasty, palatable and efficient mixtures

ANDREW M BABEY

Synopsis of Obstetrics and Gynaecology By Aleck W Bourne, M A Seventh edition. Duodecimo of 452 pages, illustrated Baltimore, William Wood and Company, 1937 Cloth, $4 00

This is the seventh edition of a little book first published in 1913 Very similar to a quiz compend, it covers with remarkable brevity and clarity the entire domain of obstetrics and gynecology It is designed primarily to assist students in preparing for examinations, and for that purpose it is excellent, and can be heartily recommended It is not a textbook.

CHARLES A GORDON

The Diary of a Surgeon in the Year 1751-1752. By John Knyveton, M D Octavo of 322 pages, illustrated New York, D Appleton-Century Co, 1937 Cloth, $2 50

The diary of a surgeon in 1751–52 is a robust tale of medicine and society in the eighteenth century

The diarist is a young man from the village of Hestley in Kent The diary begins with his last day of apprenticeship to his uncle He lodges with Mr Hunt who takes him to church on his first Sunday in London "A wearisome sermon of some hour and a quarter upon the spiritual elements of man, the which I beguiled may Heaven forgive me in quizzing, a pretty wench who sat in the musicians' gallery and led the singing with a fair sweet voice, and she proving demure, to sleep"

He joins an anatomy class, attends a hanging, "of a woman who stole three loaves" and a boy "who is to be half hanged and whipped through the town as a warning against begging" Then follows the gruesome and vivid description of the event Later he takes part in the expedition which steals the body at midnight from the graveyard, behind his tutor's house.

John Knyveton is a serious young man

not without a sense of humor, a born story-teller With a few bold strokes, he sketches a whole scene of an operation with its blood and agony, a brawl between students, body snatching at midnight, a storm at sea, the horrors of yellow fever, a battle with pirates

Listen to him philosophising on "The Puerperal Fever" "This is a Queer and Mysterious Complaint, I am almost tempted to desert my Principles, and think it in the nature of a Visitation It cannot always be a Wrath of Nature at Man's interference, especially through the use of instruments, for I have in my studies here seen it occur both after a Gentle Labour and in one attended with difficulty, where there was much interference with the woman, and with the child."

The diary is an absorbing and thrilling narrative of an entertaining age.

FRANCIS B DOYLE

Genital Abnormalities, Hermaphroditism & Related Adrenal Diseases By Hugh Hampton Young, M D Quarto of 649 pages, illustrated. Baltimore, Williams & Wilkins Company, 1937 Cloth, $10 00

This is a remarkable book written by a man who is not only a master of urology but a master of plastic surgery as well, and is profusely illustrated by a superb artist

The first third of the book is devoted to hermaphroditism in all of its various phases, history, embryology, numerous case reports and the various surgical measures employed in an effort to restore these unfortunate individuals to a reasonably normal state The various types of this deformity are thoroughly discussed, and many remarkable and ingenious operative procedures are described and illustrated in detail The results which Dr Young has obtained from his operations on many of these cases reads almost like a fairy tale

There is an important chapter on the adrenogenital syndrome which includes a detailed description of the author's original method of simultaneous approach to both adrenals

The chapter on hypospadias describes only a few of the many operations devised for the relief of this condition, but they are thoroughly done The reviewer regrets that the Ombredanne operation was not included

The chapter on exstrophy of the bladder is short The author stresses the importance of plastic procedures in an effort to preserve the bladder, and criticizes the present wave of enthusiasm for ureter transplant and cystectomy which he thinks should only be considered as a last resort

There are several other chapters dealing with various congenital deformities These, too, are excellent.

We are sure this book will be carefully read by every urologist and general surgeon. The illustrations throughout are superb

NATHANIEL P RATHBUN

Diseases of the Skin. A Manual for Students and Practitioners By the late Robert W MacKenna, M D Fourth edition revised and enlarged by Robert M B MacKenna, M D Quarto of 557 pages, illustrated Baltimore, William Wood and Company, 1937 Cloth, $7 00

The author states in his preface that this is primarily a book for students and practitioners, and he has, therefore, omitted description of some of the rarer skin diseases, and has not given a complete bibliography This book is particularly well suited to just such readers

The description of all the diseases is concise yet adequate, and includes complete differential diagnosis and complete and plain directions for treatment. Most of the prescriptions are given in both the Metric and Apothecaries System

The author has not adhered to the old classification of skin diseases, but has tried to classify them according to etiology While this is perhaps not an important matter to the student or practitioner we believe the old classification is more simple and easier to master No classification is as yet satisfactory

This edition has been thoroughly revised and brought up to date and includes all the recent discoveries and theories in Dermatology

The chapter on Drug Eruptions is too short, and many common drugs causing skin eruptions have been omitted Occupational dermatoses is also an important subject which receives too little attention. The introductory chapter includes no discussion of general pathology This was perhaps done purposely but we believe it should be included The chapter on diseases due to Vegetable Fungi is remarkably full of valuable information

The chapter on syphilis is as complete as can be expected in a book on dermatology alone The author advises the intermittent method of treatment whereas most syphilologists in this country use the continuous method of treatment.

The illustrations are numerous, good and remarkably clear We recommend the book highly to students and general practitioners

ALFRED POTTER

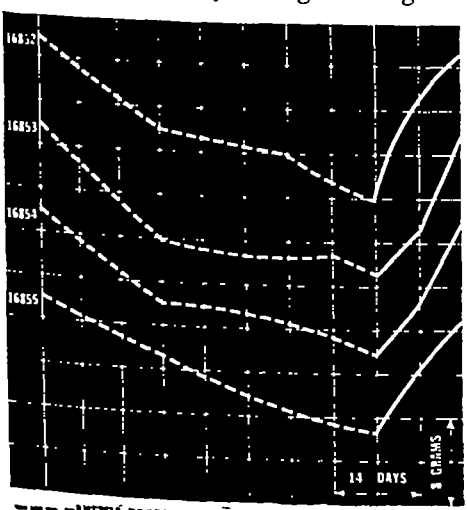
● Here is tomato juice with *official proof* that it is made from prize-winning tomatoes Four years in a row the men named Indiana Tomato Champions by Purdue University grew tomatoes for making into Kemp's Sun-Rayed Besides, as high as 88% of all our thousands of acres have won gold or silver medals during a single year Awards are based on records kept by U S Gov't graders This careful selection of fruit and use of the WHOLE tomato—all the red-ripe solids—by patented process (U S Pat 1746657) insures the vitamin-potency, full-bodied consistency and flavor for which Kemp's Sun-Rayed is famous THE SUN-RAYED Co , Frankfort, Ind N Y Representative Segger-man-Nixon Corp , 111 Eighth Ave

Kemp's SUN-RAYED
PURE TOMATO JUICE

FROM ANEMIA TO NORMALCY



In a clinical experiment, all animals were given weighed quantities of anemia-producing diet Hemoglobin determinations, using Dare and Newcomer methods, were made on 1st, 16th, 37th, 45th and 51st days On 51st day, hemoglobin of each animal showed less than one-half of normal

Then supplementary feeding of 2 84 grams of Cocomalt was started Hemoglobin determinations made on 7th and 14th day of this period The determinations on 14th day showed that hemoglobin content of the blood of all animals had returned to normal

Thus *you* are assured that the Iron in Cocomalt is effective Leading authorities agree that 3 glasses of Cocomalt a day supply the optimum Iron requirement of the normal patient

— — — =ANEMIA PRODUCING DIET—
——— =ANEMIA PRODUCING DIET + 2.84 GMS. COCOMALT DAILY

CONVALESCENTS Time and again Physicians have found that Cocomalt revives interest in food, aids in rebuilding strength and vitality

GROWING CHILDREN Depending upon age, the carbohydates and proteins in a glass of Cocomalt supply 1 to 2 hours of vital energy to the growing child

Cocomalt is the registered trade-mark of R B Davis Co Hoboken N J

CALCIUM, PHOSPHORUS, VITAMIN D

Here are other examples of the clinical care with which Cocomalt is compounded The 15 gram of Calcium, 16 gram of Phosphorus are made available because along with them there is, in each ounce serving of Cocomalt, 134 U S P Units of Vitamin D derived from natural oils and biologically tested for potency

Of distinctive taste Cocomalt appeals, either hot or cold, to young and old alike It is inexpensive Obtainable in ½-lb, 1-lb and the economical 5-lb hospital size purity-sealed cans at grocery and drug stores

KNOX . . . CLINICAL NOTES

ONE OF A SERIES OF CORRESPONDENCE EXCHANGES WITH PHYSICIANS ABOUT KNOX GELATINE

Query about Knox Gelatine as a Dietary Adjuvant

A friendly doctor writes, "I am treating a case of celiac disease to whom I wish to give gelatine with fruit juices, omitting sugar I shall appreciate any suggestions you can give me as to its preparation"

Knox Gelatine Laboratory Replies—

Here are two good ways to administer Knox Gelatine in concentrated form:

THE KNOX BANANA STIR

Thoroughly crush one ripe banana Sprinkle over it 2 envelopes of Knox Gelatine, mixing banana and gelatine while stirring After it is well mixed, serve

Total Approximately 250 calories

THE KNOX FRUIT STIR

Place the contents of 2 envelopes of Knox Gelatine in an ordinary saucer or cereal dish Add 8 tablespoonfuls of any desired fresh or canned fruit juice, such as grape juice. Let soak for five minutes and eat with teaspoon

Total 4 ounce mixture—100 calories

Why You Should Insist on Knox Sparkling Gelatine

Because Knox Gelatine is 85% protein in an easily digestible form—because it contains absolutely no sugar or other substances to cause gas or fermentation, Knox Gelatine should not be confused with factory flavored, sugar-laden dessert powders. Knox is 100% pure U S P gelatine. Knox Gelatine has been successfully used in the dietary of convalescents, anorexic, tubercular, diabetic, colitic, and aged patients.

Sample and useful Dietary Booklets on request Write Dept 474

KNOX SPARKLING GELATINE

IS PURE GELATINE—NO SUGAR

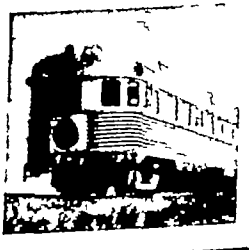
Summer Diarrhea in Babies

Casec (calcium caseinate), which is almost wholly a combination of protein and calcium, offers a quickly effective method of treating all types of diarrhea, both in bottle-fed and breast-fed infants For the former, the carbohydrate is temporarily omitted from the 24-hour formula and replaced with 8 level tablespoonfuls of Casec Within a day or two the diarrhea will usually be arrested, and carbohydrate in the form of Dextri-Maltose may safely be added to the formula and the Casec gradually eliminated Three to six teaspoonfuls of a thin paste of Casec and water, given before each nursing, is well indicated for loose stools in breast-fed babies Please send for samples to Mead Johnson & Company, Evansville, Indiana —*Adv*

for 1938

Santa Fe *presents*

AMERICA'S LARGEST FLEET OF ULTRA-MODERN STREAMLINED TRAINS



for California

AND SOUTHWESTERN TRAVEL

● For your pleasure on 1938 California and Southwestern journeys, Santa Fe presents 13 magnificent new trains, streamlined in gleaming stainless steel!

This fleet embodies the very latest in rail travel comfort, beauty and speed It includes by far the largest array of ultra-modern passenger equipment on any American railroad It adds new dash and joy to economy travel and de luxe travel alike It is ready, NOW, to fit into your spring and summer plans

A BIG STORY IN A FEW WORDS

● There is now twice weekly service on the superb streamlined *Super Chief*—only *solid Pullman*, 39¾ hour *extra fare train* between Chicago and California

● Six new streamlined *Chiefs* further emphasize the distinction of this finest and many hours fastest of all California *daily* trains

● The revolutionary new twice weekly streamlined *El Capitan*—only all chair-car transcontinental *train*—combines low fares and low cost meals with beauty, comfort and the supreme speed of the *Super Chief*

● Between *El Capitan* and the daily *Scout* (popular coach and tourist *sleeper transcontinental train*), Santa Fe has truly lifted economy travel to a new plane of pleasure

● Then there are new Santa Fe streamliners between Los Angeles *and San Diego, and Chicago and* Kansas City; with improved schedules and equipment on the popular *and long established Santa Fe trains* that contribute greatly to the pleasure and convenience of western journeys

TRAVEL *and* RESORTS

WHERE TO GO • HOW TO GO • WHAT TO DO • WHERE TO STAY • WHERE TO DINE

Westward! By Land, by Sea, by Air!

The trip to the A M A Convention at San Francisco in June, brings to the fore a diversity of travel ways for the physicians in the east

For those who are forced to economize on time, the air ways loom as the practical way of spanning the continent in the shortest space of time The distance from the east coast to the west coast can be traversed in about twenty hours—with a good opportunity to catch up on sleep in a comfortable berth This means it is possible to leave the east in the late afternoon of June 12th (Sunday) and arrive in San Francisco at noon of the opening day of the Convention The return trip can be made to arrive home on Saturday, the day after the close of the Convention So the entire time required to attend the San Francisco meeting is just a few hours over six days Ten-day stopovers are permitted at any regular stop, so the time can be extended for visiting other places if there is a desire to do so

For those who plan to make a little more of an excursion of their western trip, both the Santa Fe and the Canadian Pacific railroads offer many pleasant sidetrips and opportunity to see the wonders of the Rockies The Santa Fe features special train convention parties leaving Chicago on June 6th, with sightseeing in the Indian country at Old Santa Fe, New Mexico, on the 8th On the 9th, time will be spent viewing the Grand Canyon The 10th and 11th will be spent "doing" Los Angeles and its vicinity The 12th will be spent on a trip to beautiful Santa Catalina Island—and the arrival in San Francisco is scheduled for 9 00 A M of the 13th These convention

AMERICAN AIRLINES Inc.

specials are for physicians and their families and friends only, and a choice of routes is permitted for the return east

The Canadian Pacific railway features the return trip of the American Medical Golf Assn Tour, with stopovers June 19 to 21 at Banff and Lake Louise in the Canadian Rockies For those who have pretty well explored the Rockies in the United States, here is the opportunity to compare them with the Canadian Rockies, or for those who wish to travel home on a different route the Canadian Pacific opens a new world of interest. At Banff Springs Hotel, you can golf on a mile-high course, swim in warm sulphur and fresh water pools, ride with cowboy guides, or do any number of interesting things At Chateau Lake Louise you can rest and relax amid snowy peaks Fast transcontinental trains—air-conditioned—will speed you back to the east.

For the sea-going physician, an opportunity is open to accompany the American Medical Golf Association on its tour west which includes a special steamer from the north The first game will be played in New Orleans, reached by the Steamship S S Dixie, from New York (or via a rail itinerary) on June 7 Other stops include Houston, Galveston, San Anonio, Los

Great Western

AMERICAN WINES

When a patient requires a superior champagne during convalescence specify "Great Western"

Produced since 1860 in the Finger Lakes region of New York, from grapes grown under soil and climatic conditions matching those of the great wine-producing regions of France, Great Western wines have been well recognized by the medical profession

All Great Western Champagnes are made by the old French method of secondary fermentation in the bottle They thus possess the optimum carbon dioxide content Yet Great Western sells at a most reasonable price

GREAT WESTERN WINES

Vermouth Dry and Sweet

Champagnes Dry, Medium and Sweet The American champagne that won medals in Paris Brussels and Vienna

Still wines (under 14% alcohol) Sauterne Rhine, Claret still Burgundy

Still wines (18% alcohol) Sherry, Port Tokay, Sweet Catawba, Muscatel

Try PABLUM on Your Vacation

VACATIONS are too often a vacation from protective foods For optimum benefits a vacation should furnish optimum nutrition as well as relaxation, yet actually this is the time when many persons go on a spree of refined carbohydrates Pablum is a food that "goes good" on camping trips and at the same time supplies an abundance of calcium, phosphorus, iron, and vitamins B and G It can be prepared in a minute, *without cooking*, as a breakfast dish or used as a flour to increase the mineral and vitamin values of staple recipes Packed dry, Pablum is light to carry, requires no refrigeration Here are some delicious, easy-to-fix Pablum dishes for vacation meals

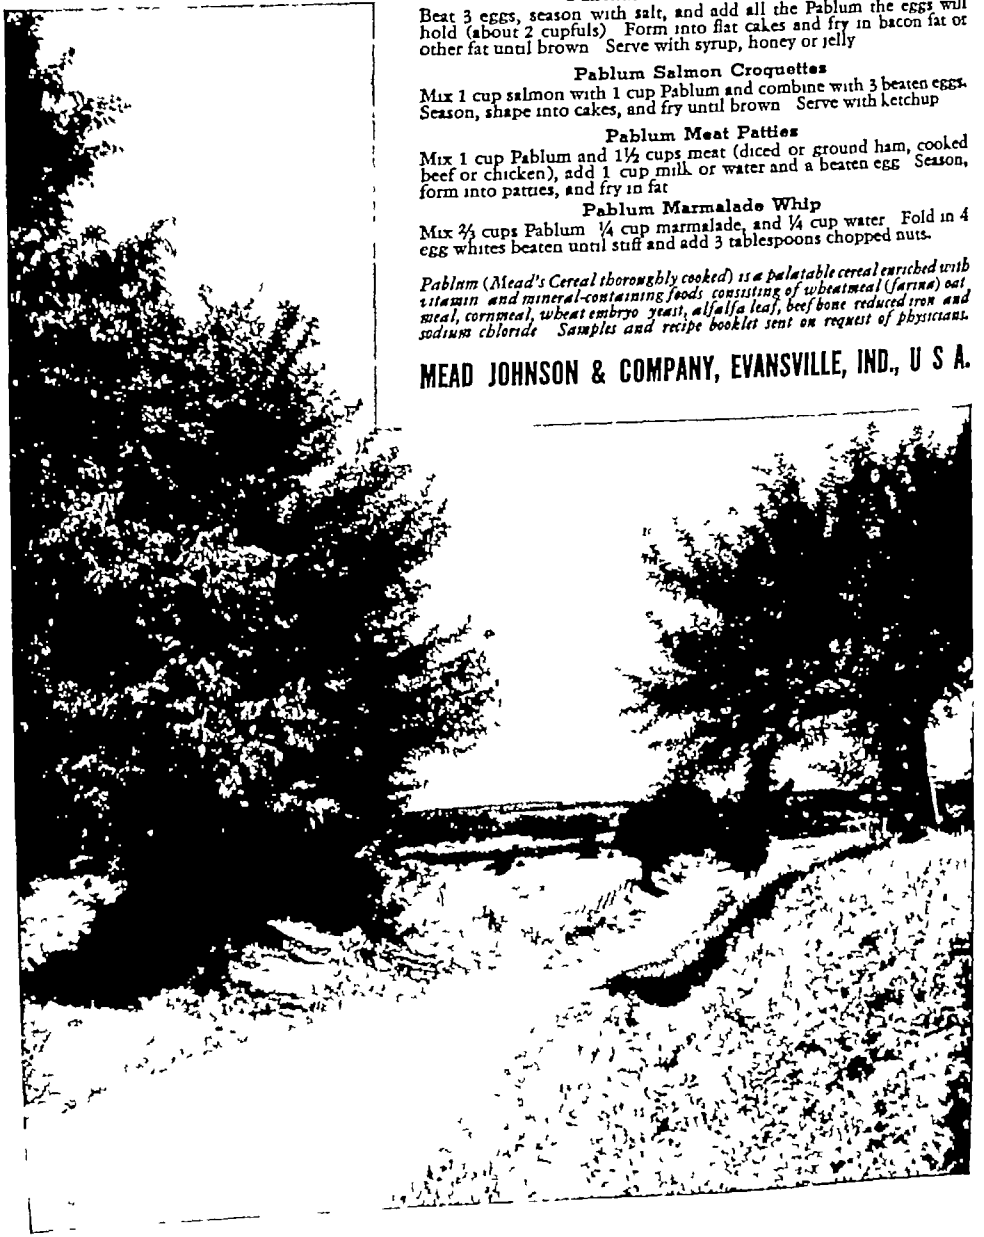
Pablum Breakfast Croquettes

Beat 3 eggs, season with salt, and add all the Pablum the eggs will hold (about 2 cupfuls) Form into flat cakes and fry in bacon fat or other fat until brown Serve with syrup, honey or jelly

Pablum Salmon Croquettes

Mix 1 cup salmon with 1 cup Pablum and combine with 3 beaten eggs. Season, shape into cakes, and fry until brown Serve with ketchup

Pablum Meat Patties



Mix 1 cup Pablum and 1½ cups meat (diced or ground ham, cooked beef or chicken), add 1 cup milk or water and a beaten egg Season, form into patties, and fry in fat

Pablum Marmalade Whip

Mix ⅔ cups Pablum ¼ cup marmalade, and ¼ cup water Fold in 4 egg whites beaten until stiff and add 3 tablespoons chopped nuts.

Pablum (Mead's Cereal thoroughly cooked) is a palatable cereal enriched with vitamin and mineral-containing foods consisting of wheatmeal (farina) oat meal, cornmeal, wheat embryo yeast, alfalfa leaf, beef bone reduced iron and sodium chloride Samples and recipe booklet sent on request of physicians.

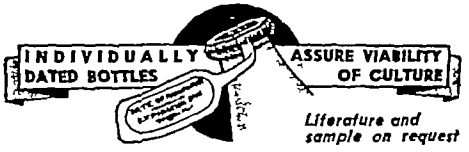
MEAD JOHNSON & COMPANY, EVANSVILLE, IND., U S A.

IN SUMMER

Diarrhea

SHEFFIELD B. ACIDOPHILUS MILK*

for Infants



As the majority of cases of diarrhea in children occur during the months of excessive hot weather, it is evident that the physician will confront an increasing number of these cases from now on until Fall

B acidophilus milk may be effectively employed in controlling the various toxic diarrheas and other gastrointestinal disturbances in infants and children, as well as in infant feeding

For infants the culture is diluted with boiled water (cooled) or lime water in proportions the case may indicate From 12 to 16 ounces of SHEFFIELD B ACIDOPHILUS MILK per day, properly diluted, have yielded satisfactory results Milk sugar should be added to bring the sugar content to the desired level as ordinarily recommended for preparing "modified milk" formulae

The curd in SHEFFIELD *B acidophilus Milk* is very fine, soft and flocculent, assuring satisfactory digestion and absorption

COUNCIL ACCEPTED

Vitamin C deficiency

comparable to the severe scurvy which ravaged the British Navy prior to 1804, when Sir Gilbert Blaine secured the adoption of regulations enforcing the daily ingestion of lemon juice as a preventive measure, is seldom encountered at the present time

Recently, however, several investigators have called attention to the existing widespread occurrence of mild vitamin C deficient states which, if unrecognized and untreated, may progress to clinical, and even frank scurvy

Such states of vitamin C deficiency may result from stringent adherence to restricted diets in the treatment of peptic ulcer, colitis, urticaria, and other affections, or may be precipitated by increased requirements during infections and febrile conditions Abnormalities of absorption conditioned by gastro-intestinal disease may necessitate the parenteral administration of cevitamic acid

Vitamin C deficiency, whether due to an inadequate intake of the vitamin or a pathologic interference with its assimilation, may be corrected and prevented by the administration of

BUFFERED ALKALINIZATION

by the safe, physiological process

WHERE buffered alkalinization is desirable—as during sulfanilamide administration, in the treatment of colds, influenza and other seasonal respiratory affections—Kalak offers these clinical advantages

(1) It presents a balanced combination of bicarbonates in solution (2) It contains the mineral substances normal to the blood (and no other)

Kalak's high buffering value helps to maintain the urinary pH of 7 4 which has been found so desirable in sulfanilamide therapy.

KALAK

is synthetically prepared—is hypertonic, uniform in composition, definite in alkali potency

Immunize now for effective control of

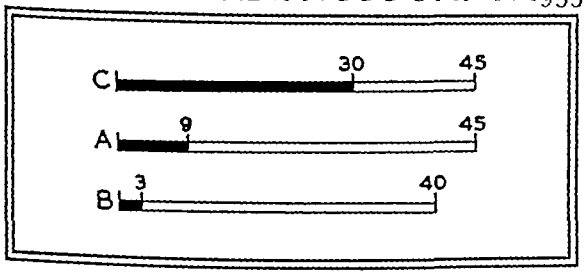
IVY DERMATITIS

PLANS FOR SPENDING summer vacations outdoors or at summer camps should include preliminary prophylactic administration of Poison Ivy Extract to avoid the risk of much misery and spoiled vacations from ivy poisoning

Experience has shown that two small injections (1 cc each) of Poison Ivy Extract *Lederle* administered a week or two apart confer a marked degree of protection in a high percentage of cases against the distressing dermatitis which follows the usual casual accidental contact with Poison Ivy This protection should suffice to immunize the individual for the entire season

In the *treatment* of ivy poisoning Poison Ivy Extract *Lederle* has at times performed most spectacularly A single injection often gives marked relief within 24 to 48 hours A second injection 24 hours later may be required this has an added value in its probable preventive effect in case of later exposure A third injection is rarely necessary

RESULTS OF EXPERIMENT IN C C C CAMPS IN 1935



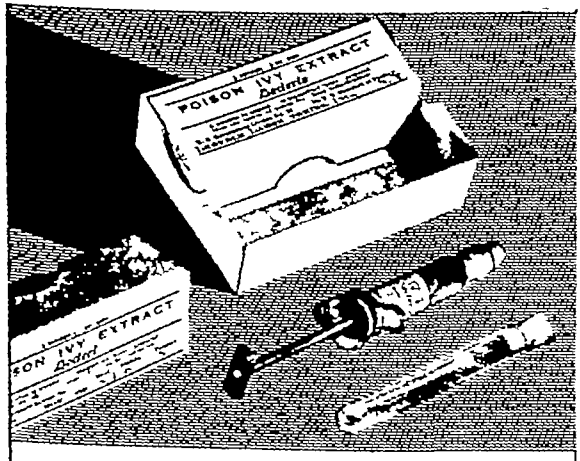


Chart shown at left covers a 6 week period following the first prophylactic dose One hundred and thirty men were divided into three groups A B C All intermingled in their work in clearing ivy infested areas

Group C received no previous injections

Group A received four weekly injections of 1 1 *regular dose of* "Poison Ivy Extract *Lederle*

Group B received four weekly injections of the regular dose of Poison Ivy Extract *Lederle*

The shaded areas represent the number of exposed men affected with ivy dermatitis in the 6 week period

For prevention and treatment

POISON IVY EXTRACT

NATIONAL

TETANUS TOXOID

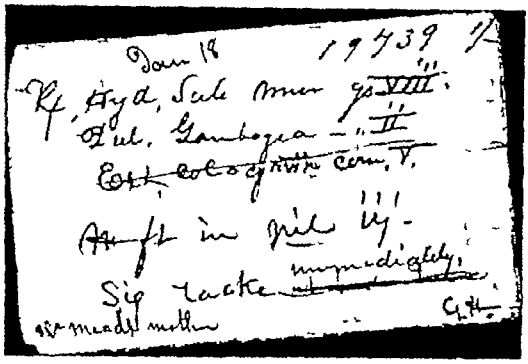
(Refined Alum Precipitated)

Prevents Tetanus

Tetanus Toxoid produces an active immunity against tetanus Persons subjected to repeated wounds in the industries and in all departments of the military service should be actively immunized with two doses of Refined Tetanus Toxoid. Active immunization may last for several years. Cost is moderate. Reactions and pain of injections are negligible.

Refined Tetanus Toxoid contains no serum, it does not sensitize or cause serum reactions Tetanus Toxoid should be used for immunization Never for treatment of tetanus!

IMPORTANT Give Tetanus Antitoxin for immediate protection of patients who have received injuries which may become infected, if they have not been immunized with Tetanus Toxoid Immunized patients should receive a third dose of Tetanus Toxoid



FOR TREATMENT OF TETANUS

Full doses of National Tetanus Antitoxin (Refined and Concentrated Globulin) are indicated

Send me brochure on National Tetanus Toxoid and Tetanus Antitoxin NYS 6-38

"TRUE-TO-LIFE" PICTURES

of the upper urinary tract

HIGHLY INFORMATIVE SHADOWS DENSE, SHARPLY OUTLINED

Nowadays so much reliance is placed on the diagnostic data obtainable by intravenous urography and pyelography that the importance of the radiopaque material employed cannot be overestimated For excretion urography, the merits of Diodrast have been repeatedly demonstrated by the extensive experiences of urologists and roentgenologists in numerous medical centers of America *The properties which render* DIODRAST *particularly acceptable are as follows*

1 Diodrast gives a dense and comprehensive anatomic delineation of the upper urinary tract Pathologic conditions are usually revealed with great clarity
2 Excellent urograms may be secured with little or no local pain to the patient during or after injection and with little likelihood of systemic reactions
3 There is no inconvenience in administering Diodrast The solution in the ampules and vials is sterile, stable and ready for use The average dose for an adult is 20 cc , and for a child 10 cc

Diodrast is supplied in a sterile solution (35 per cent weight/volume) in ampules of 10 cc and 20 cc boxes of 1 10 and 25 vials of 30 cc with rubber diaphragm stopper boxes of 1 10 and 25 Obtainable through druggists and dealers in surgical and x ray supplies

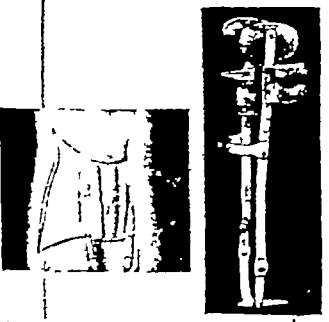
UNITY

One of the basic assumptions of the entire methodology of science is that "unity is the desired quality"

What test is to decide which of the innumerable quantitative and qualitative representations of products possess a maximum of unity? Unity depends upon the proper definition of what physical reality means

D'Abro expresses it in the sentence "What we call reality reduces to the simplest co-ordination of the facts of observation" This definition is in accord with the Greek ideal of esthetic value The Greeks, however, did not require experimental verification



Physical reality changes from day to day but physical fact does not, except as it is more accurately determined

Since 1856, more and more physical facts of manufacture have been more accurately determined in the Poythress Laboratories

Our quality pharmaceutical products are guaranteed as to purity and identity in assay of raw materials, accuracy, cleanliness and perfection of production and uniformity and correct dosage of the finished products—all supported by laboratory control records for the protection of the medical profession and their patients

Why Minerals in Your Vitamin Prescriptions?

THE close association in which vitamins and minerals are invariably found in Nature is highly significant! For when Dr Casimir Funk and Dr. H E Dubin, pioneer authorities in vitamin therapy, first revealed the cooperative interdependence existing between these essential elements, they uncovered a fact of startling therapeutic importance. Let's examine the evidence·

From the laboratory. Dr. Walter H Eddy of Columbia University tested the efficacy of A-D and A-B-D-G preparations as against that of a comprehensive vitamin-*mineral* concentrate (Vi-Syneral) His results showed that rats fed *minerals* with multiple vitamins enjoyed a measurably greater stimulation in growth "Correlated with better growth," he adds, "was better physical condition of the test animals"

From the clinician· Dr. Anthony T. Privatera tested 100 school children—part on a diet supplemented with cod liver oil, part on the same diet, but with a vitamin-*mineral* supplement (Vi-Syneral) Those receiving multiple vitamins *with* minerals over a six-months' period achieved a superior increase in weight, accompanied by a greater freedom from dental caries.

From the practicing physician: To reproduce all the reports from physicians would require a book. One Pennsylvania physician typically writes: "I think Vi-Syneral is the best balanced preparation on the market, and find therefore that it gives better results."

Vi-Syneral supplies all the definitely recognized vitamins fortified *with eight essential minerals*—in standardized potencies for each age group The preponderance of evidence endorses its prescription as a protective diet supplement, and as an adjuvant to other treatment, for the achievement of optimum good health

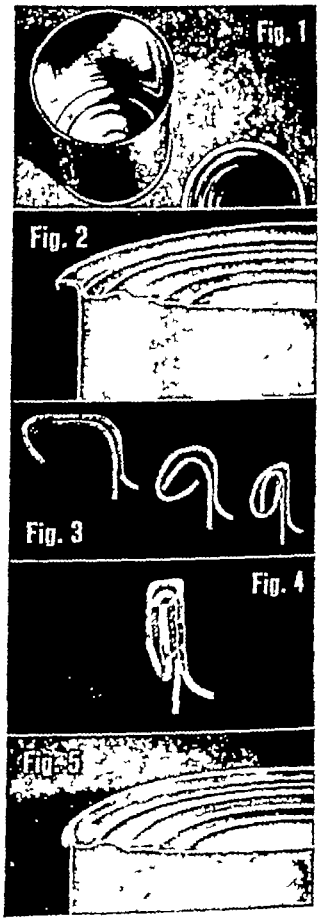
BASIC OPERATIONS IN COMMERCIAL CANNING PROCEDURES

IV. SEALING THE TIN CONTAINER

BRIEFLY, the method of food preservation commonly known as "canning" involves subjecting food in a permanently sealed container to a heat process The heat process destroys spoilage organisms present on the raw food material, the seal on the container prevents reinfection of the food by such organisms It is, therefore, obvious that the sealing operation—"closing" or "double seaming" as it is known in the industry—is one of the most important in the canning procedure

The manufacture of tinplate and "sanitary" cans is described elsewhere (1)



The open cans are received at the cannery in paper cartons or in washed paper lined box cars, together with the covers which are contained in fiber shipping tubes Figure 1 shows a can and end ready for use

In modern canning practice, the cans are first conveyed by automatic runways to can washers, and thence to the filling tables or fillers where the correct amount of properly prepared raw food is put into the cans The covers or "ends" are placed in the automatic sealing or "closing" machine to which the open can containing the food is mechanically conveyed In this machine the ends are "double seamed" onto the can This operation is portrayed by the accompanying cross sectional pictures

In Figure 2 is shown the relation of can to cover before the sealing operation is started, note the relative position of the "curl" on the cover and the "flange" on the can In this curl, the can manufacturer has placed a gasket or "compound," usually containing rubber Figure 3 is a series of photographs illustrating the sealing operation in which the curl and flange are first rolled into position and then the layers of metal flattened together to form the final "double seam" in Figure 4 The rubber compound originally present on the cover supplies the binding material between the layers of metal necessary to insure a permanent or hermetic seal on the container Figure 5 illustrates in cross section a closed sanitary can as it comes to the consumer

In the past twenty five years great progress has been made in the development of tinplate, compounds and automatic sealing machines Collectively, these developments enable present-day canners to impose a permanent seal on the cans containing their products more easily and rapidly than ever before in the history of canning

ACCEPTED

The Seal of Acceptance denotes that the statements in this advertisement are acceptable to the Council on Foods of the American Medical Association

milk

a "protective" food important in reducing regimens

Reducing regimens which are based on a decreased caloric intake *must* contain an adequate amount of the "protective" foods, such as milk, fruits and green vegetables, or the diet may cause physical discomfort This is an elementary fact to physicians, although perhaps not so well appreciated by laymen

Thus the Bureau of Milk Publicity of the State of New York in its campaign to increase milk consumption among adults is emphasizing the importance of the "protective" foods, calling attention to the dangers of unscientific dieting, and suggesting that the regimen be supervised by a competent physician *The Bureau of Milk Publicity, Albany*

THE STATE OF NEW YORK

"What's behind the label"

—concerns you most

As a professional man you realize better than the layman that foods are not alike merely because they come in similar containers. Because the human body does not respond promptly by showing accurately the effects of food taken in, many consumers (perhaps your patients) think that one brand is as good as another—that satisfaction of appetite is the only object to be achieved.

The high quality of fruits and vegetables used, the sanitary equipment and careful handling combine to make Wegner's different and a dependable product for your everyday use or dietary recommendation.

SULFANILAMIDE IN THE TREATMENT OF UROLOGICAL INFECTIONS

TERRY M TOWNSEND, M D, F A C S and THOMAS M MULCAHY, B S, M D,
New York City

From the Department of Urology of Riker's Island Hospital, Department of Correction of the City of New York

This presentation is based on the observations of 171 patients suffering from infections of the urologic tract, chiefly gonorrhea, and treated with sulfanilamide Twenty-seven of the patients were either ambulant or hospitalized in Morrisania City Hospital, fifty-four were inmates of Sing Sing Prison Hospital either ambulant or hospitalized, and ninety were inmates of Riker's Island Hospital of which all were hospitalized Because of inadequate control and lack of continuous observation the first two groups are not included in this close analysis

Prior to the institution of treatment each man was proven to harbor gonococci in his urethral discharge Each was given a complete physical examination including urinalysis and a blood study Constipation was relieved by mineral oil or enemata All other habits of life were kept regular by institutional control

The intensity of the infections varied from frank yellow copious urethral discharge to a slight morning excess of urethral moisture expressible from the external meatus urinarius Forty-four per cent of the ninety men had primary infections Three per cent had infections of less than one week in duration, eighteen per cent less than one month sixty-two per cent less than one year, and seventeen per cent suffered from infections of from one to seventeen years

Agreeably to the advice of Dr J F Mahoney of the United States Public Health Service, the following routine of treatment was established

(a) Twenty grains of sulfanilamide were administered by a nurse every four hours from four to six days

(b) Temperatures were taken every four hours

(c) Fluid intake was restricted to 1500 c c per diem

(d) Urethral smears were taken daily before the morning urination

(e) Weight was noted three times weekly

(f) Bed rest was advised but not mandated

All animal experiments together with previous clinical reports prove that best results are attained by pushing the drug to its maximum dosage during the first forty-eight hours of treatment. Since the tolerance of the full therapeutic dose varies greatly with the individual, it is most important to carefully observe the patient during this period Temperature elevation is our best guide to dosage An

Our thanks are tendered to Dr Silvio Matucci of the Riker's Island Hospital Resident Staff for his enthusiastic cooperation in this work Much of its value is due to his careful clinical observations and accurate records and charts

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 11, 1938

abrupt rise to 101° F is an indication to reduce the dosage Our men varied from this point to 105 but no permanent ill effects occurred Cyanosis is more alarming in appearance than the actual condition indicates It is due either to methemoglobin resulting from the oxidizing properties of the amino group or to the presence in the blood of the colored condensation products of aniline formed in the body Frequently when not discernible in the skin, it may be seen in the buccal mucosa

Of the ninety men started on the treatment, eighty-two finished the course The term of imprisonment of two expired, one was transferred for acute surgical treatment, one was transferred with acute hemolytic jaundice, and four were under observation when this data was collected The hemolytic jaundice came on after three days of treatment and the ingestion of only 9 3 Gm of the drug His toxic symptoms in addition to the jaundice were marked headache, dermatitis, malaise, and epistaxis He was a chronic alcoholic and had sinusitis Under treatment his red blood cell count dropped from 4,810,000 to 2,780,000, his hemoglobin from ninety-five to fifty-two, and his icteric index rose to 249 He made complete recovery under forced fluids, intravenous injections of glucose, and hematinics

Each patient showed a greater or less degree of toxicity Six were markedly toxic, twenty were moderately, and sixty-four were but slightly toxic. Review of the recorded toxic manifestations show that every man had headache and cyanosis, sixty-three had nausea and vomiting, and fifty-three had anorexia Fever from 100 to 105° F with malaise and general debility occurred in thirty-nine One of the most frequent symptoms was vertigo, of which eighty-one complained Twenty-nine had generalized muscle pains, especially over the precordium This precordial pain led many to object to taking medication as they believed it was affecting their hearts Flatulence was seen in nineteen, chills in four, and dyspnea in three Insomnia was observed in sixteen, and thirteen were drowsy with slight disorientation Twelve men had a general or localized dermatitis and five had parathesia Sixteen patients complained of tinnitis, eight had strong metallic taste in the mouth with discoloration of the mucosa, and three had diplopia

Reduction in hemoglobin was a fairly constant finding With the exception of the hemolytic jaundice case where the drop was forty-three points, forty-five examinations showed a drop from one to thirty-seven points, the average being 13 4 points In five men the hemoglobin was unchanged and in three it increased 2, 3, and 5 points Despite this reduction in hemoglobin there was in no instance any evidence of air hunger

The efficacy of the treatment in the presence of associated constitutional disease is noteworthy for sixteen of our men were demonstrably syphilitic and two were drug addicts Local complications were present in twelve cases—urethral strictures eight, epididymitis, seminal vesiculitis, balanitis, and periurethral abscess, one each

The duration of medication was between five and ten days When temperature elevation contraindicated further administration of the drug, the urethral smears were generally negative for gonococci Four men were treated for five days, nine for six days, twenty-five for seven days, nine for eight days, twenty-two for nine days, and thirteen for ten days This variation in the duration of treatment, the quantities of the drug ingested, the intensity of the toxic symptoms, and the length of time required for gonococci to disappear points strongly to the individualistic factors involved in success of cure

When gross gonorrheal symptoms ceased and the remaining slight excess of urethral moisture was free from gonococci, other proofs of cure were instituted The expressed prostatic secretion was examined, an irritation drop produced by massage of the urethra on a metallic sound, and one ounce of whisky was given, and if all examinations failed to disclose gonococci, he was dismissed from the hospital and followed up in the ambulant clinic

For priority we wish to here record another series of tests for cure carried out by Dr Joseph Wittenberg, Adjunct Attending Urologist

He selected twenty-one of the reported

cured cases and subjected them to urethral injections of gonoendotoxin This substance when retained in the urethra for twenty minutes is followed in seven hours by a profuse purulent discharge. The first six men received three c.c. of concentrated gonoendotoxin The resultant discharge was negative to all micro-organisms The next eleven men were injected with the same amount of diluted and boiled gonoendotoxin In the resultant discharge four were negative to all diplococci and seven showed Gram negative extracellular diplococci Smears of these eleven men taken twenty hours later showed the presence of scanty Gram negative extracellular diplococci in two, no characteristic micro-organisms in five, and no bacteria of any nature in four The final four observations were made on men immediately after their course of sulfanilamide treatment. They were injected with three c.c. of diluted but unboiled gonoendotoxin, and smears taken after seven and twenty hours revealed pus corpuscles in abundance but no micro-organisms These studies of gonoendotoxin will form the subject of a future communication from Dr Wittenberg

Of the eighty-two men who completed the course of treatment, eighty-one were cured and but one failed of cure. He had suffered from a residual infection for seventeen years and had multiple strictures probably with areas of heavy fibrous tissue infiltration between the strictures Although he received thirteen Gm of the medicament in seven days, his only toxic symptom was a moderately severe headache.

In considering the causes of failure in the cure of gonorrhea with sulfanilamide one must be impressed with the lack of intensive administration of the drug in the beginning of treatment In a series of fifty-four inmates of Sing Sing Prison treated with Prontylin twenty-five per cent were positive for gonococci after one, two, or three courses of the drug, each course consisting of five Gm The fact that forty were cured after the ingestion of five, ten, or fifteen Gm is the best evidence of its extraordinary gonococcidal action

Of the Morrisania City Hospital series, twelve were hospitalized and fifteen were ambulant The latter cases gave poor results because of lack of discipline, irregularity of treatment, and impossibility of follow-up attention The bed patients uniformly progressed toward recovery Four cases of acute epididymitis became grossly normal within five days and four acute prostatitis cases became grossly normal in ten to twelve days One bedridden rheumatic was free from pain in forty-eight hours and ambulant in the ward in five days These patients received both Prontylin and Prontosil The remaining three patients improved under treatment but required surgery for their ultimate cure

The Riker's Island Hospital series of cases received Prontylin in dosages from eight to 33 8 Gm Forty-eight men required twelve Gm, fifteen received 12 6 Gm, and the other nineteen received amounts somewhat greater The small dosage of eight Gm is accounted for by the fact that the inmates term of imprisonment expired and although he was negative for gonococci and all clinical symptoms had disappeared, he was lost to our follow-up and is not included in our list of percentages

Conclusions

1 Sulfanilamide and its derivatives are the most potent drugs at our command for the cure of gonorrhea.

2 The oral administration of the drug is preferable since its toxicity is more easily controlled and that method is simpler for the general practitioner who first makes contact with the gonorrheal patient

3 Its therapeutic value seems unaffected by associated diseases

4 Success is predicated upon intensive administration of the drug to its therapeutic limit at the beginning of treatment.

5 Massive dosage produces marked toxicity which is transient and from which no permanent ill effects have been observed

6 Patients should be hospitalized in order that toxic accidents may be anticipated and controlled

7 Because of disturbances of the sensory nervous systems self-medication is dangerous and should be prohibited

8 The terminal stage of cure of gonorrhea as evidenced by the presence of scanty individual extracellular diplococci is attained in from four to nine days with this treatment

VALUE OF PHYSICAL THERAPY IN THE REHABILITATION OF COMMON HAND CONDITIONS

G G Martin, M D, *Buffalo*

In the following discussion, an attempt is made to bring out in some detail, the indications for, and the results to be expected from the use of physical measures Physical therapy is frequently mentioned as being of value and dismissed with a line to this effect In no branch of therapy is attention to detail more important

Lower Motor Neurone Lesions

Flaccid paralysis, involving either the intrinsic or extrinsic muscles of the hands, results from a variety of causes Each case presents individual problems, but certain fundamentals can be discussed

The muscle weakness is seldom the only evidence of nerve involvement and sensory or trophic changes are present necessitating consideration in a plan for treatment

Diminution of the sensation of pain and a loss of discrimination of temperature changes are frequently encountered Heat is applied almost universally in treatment of these conditions, to secure an adequate circulation Before beginning treatment, a careful search for sensory changes should be made Such changes do not prevent the use of heat, but make advisable its application under carefully controlled conditions

We have found the paraffin bath particularly suitable and prefer it to other sources of heat It has the advantage of heating the hands uniformly on all sides and demands a minimum of attention Dickson[1] gives complete instructions regarding its use It can also be used in a more simplified form as described by Gill[2] A paraffin bath leaves the skin in a particularly satisfactory condition for subsequent treatment including massage, and is safe, if the temperature is properly regulated, to meet the condition present in the hand Heat must be applied for at least thirty to forty minutes to produce the desired effect and it is frequently an advantage to maintain an elevation of temperature around these hands for several hours a day It is always important to make provision for keeping the hands warm and to prevent exposure to cold

Trophic changes are usually present to some degree The failure of an adequate function of the neurovascular apparatus frequently results in edema and disuse aggravates this The most serious result is the tendency to the formation of fibrous adhesions The multiple small joints of the hands and fingers, the long tendons of the extrinsic muscles, and the closeness of skin to the underlying bone, make the hand particularly prone to this type of limitation of movement

Massage is given following the application of heat but it frequently fails of its purpose because it is not applied with a definite objective in view Superficial and deep-stroking massage carried well up the arm will increase the value of heat in securing a more normal vasomotor control The decrease in edema and a more active color response to a change in position are clinical signs of this improvement Friction should be given gently as its purpose is to prevent adhesion formation between the layers of tissue and to gradually stretch and lengthen adhesions already formed It should be given in the region of the joints, working around the capsule and ligament, and along the course of the tendons The skin of the fingers should receive attention to prevent fixation to the underlying structures Other types of massage are not indicated in this type of hand condition

Passive movement must be considered, particularly when active movement is not possible Mennell's[3] division of passive movement into relaxed or free movement, and forced movement, seems of fundamental importance Free passive movement is a useful procedure and is helpful

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 26, 1937

in determining the success of efforts to maintain the mobility of the joints

Under the above program, the muscles will share with the other soft tissue in the benefits to be derived from the attempt to reduce the effects of trophic changes and muscle atrophy will be reduced to a minimum But the muscles must also be provided with support and rest In the early stages of recovery, this is more important than exercise When all the muscles of the hand are involved, the position of rest is the position of writing, with the fourth and fifth fingers slightly abducted This position has been well described by Kanavel[4] as "the position of function," and its importance cannot be overemphasized

The problem of muscle development involves two factors—strength and coordination Coordination is unusually important in the development of a useful hand In general the extrinsic muscles supply the strength of the hand and the intrinsic muscles, the coordination The latter are a more difficult group to train and require special attention McNamara[5] has recorded a detailed study of these muscles which repays reading

The thumb is the most important unit of the hand The simple movements of flexion and extension occur at the interphalangeal joint which is controlled by the long flexor and extensor pollicis, and the metacarpal phalangeal joint, which is moved by the flexor pollicis brevis and the extensor pollicis brevis These movements of extension and flexion are the main movements of these two joints The other movements of the thumb are carried out mainly at the carpometacarpal joint. The simple one of adduction is carried out by the adductor pollicis which is a relatively powerful intrinsic muscle and adducts the thumb in the plane of the palm The abductor pollicis longus produces abduction in the plane of the palm and the abductor pollicis brevis at right angles to it

The other movement which can be performed separately is rotation at this joint It is performed mainly by the opponens muscle and is one of the most difficult movements of the thumb to reacquire The frequent failure of the opponens muscle to develop as rapidly as the remainder of the thenar group is due to lack of effort directed towards the development of this particular rotation movement

Opposition of the thumb to the fingers is a complicated movement in which several muscles take part McNamara[5] states that it involves

1 Abduction from the plane of the palm by the intrinsic abductor
2 Rotation so that the pad of the terminal phalanx and not the ulnar margin comes in contact with the tips of the other digits
3 Flexion of the metacarpophalangeal joint.
4 Action of the abductor in sweeping the thumb across the palm

It is thus a movement involving coordination between several muscles and is not the result of action of the opponens muscle alone

Exercises aimed at the development of the muscles of the thumb are best carried out halfway between supination and pronation with the forearm lying on its ulnar side

The movement of the interphalangeal and the metacarpal phalangeal joints should be given both separately and combined Adduction and abduction of the thumb in the plane of the palm should be carried out as well as abduction at various angles from the palm A rotation movement with the thumb in an extended position should be practiced Finally the combined coordinated movement of opposing the thumb to the tips of the fingers should be given Drawing the thumb toward the fifth finger over the flexed fingers is useful If special attention is not given to the development of all these muscle groups, it will often be found that an incomplete recovery has occurred with one or another group failing to develop The opponens muscle frequently shows this failure

The problem involved in redevelopment of the finger muscles is similar, but is less complicated The flexion and extension of distal and proximal interphalangeal joints are carried out by the long flexor and short extensor muscles respectively The lumbricales exert a more powerful action on these joints than the extrinsic extensors and for practical purposes the latter can be ignored The extrinsic flexors are powerful muscles and require exercise for development of

strength The movements of these joints can be carried out by supporting the metacarpal phalangeal joints in extension The metacarpal phalangeal joints are mainly under the control of the intrinsic muscles The exception to this rule is the extensor digitorum communis which act powerfully to extend the joints Flexion is carried out by the lumbricales The best movement for the development of flexors and extensors is carried out with the fingers straight, i e, interphalangeal joints in the position of extension

Three sets of movements are necessary, therefore, for the development of flexors and extensors of the fingers One is the flexion and the extension of the interphalangeal joints with the metacarpal phalangeal joint held in extension The second is flexion and extension of the latter joint, with the former held in extension Additional coordinated movement should be given in which all three joints participate, so that the separate groups of muscles learn to act in a coordinated manner If the above routine is not followed, good flexion and extension of the interphalangeal joints may be possible but the metacarpal phalangeal joints frequently will be found to be very stiff Exercises for the flexion and extension of the fingers can be given with the hand on the ulnar side in the position described for exercise of the thumb

Adduction and abduction are movements of the metacarpal phalangeal joint which are frequently overlooked These movements can be considered to occur from a line drawn through the center of the third finger The dorsal interossii produce abduction of the fingers from this line, the palmar interossii produce adduction These actions are reinforced by the long extensors and long flexors respectively If the action of the interossii muscle is lost, the movements can be carried out but they are relatively weak and poorly coordinated

Exercises for development of these muscles can be carried out with the hand lying palm downward on a smooth board Instruct the patient to abduct and adduct respectively with the third finger at rest The above described exercises are necessary as long as assisted movement is indicated and are particularly important in the development of coordination When the patient has progressed to the point where assisted movement is no longer necessary, better results will be obtained with work which requires coordinated movement Simple occupational exercises include squeezing sponges, rubber balls, the use of molding clay, picking up of various objects and painting Later the use of typewriter, screw driver, various types of repair work, sand papering, knitting, sewing, and similar movements are useful

The majority of patients with this type of paralysis of the hand muscles do not show complete involvement of all the muscles Recovery is seldom uniform and it is, therefore, frequently necessary to pay attention exclusively to weak muscles and to ignore the stronger ones At times it is necessary to intentionally splint strong opposing muscles to the point of causing disuse atrophy Harmer[6] has stressed the importance of the avoidance of the use of antagonist muscles after the nerve and tendon suture, and recommends early active movement of the affected muscles This principle should be followed in regard to the muscles which exhibit a greater degree of paresis or a failure to recover as rapidly as their opponents

Electric stimulation with galvanic or faradic current is occasionally of value The technic of application to the intrinsic muscles of the hands is difficult and has a more limited field of usefulness than for other muscles of the body

Upper Motor Neurone Lesions

The hand is usually involved in hemiplegia and other types of upper neurone lesion The recovery of hand function and particularly of coordinated movement is very difficult In selected patients who are cooperative, treatment should be started as soon as signs of recovery are noted

When active treatment is started, the first point to be considered is the degree of spasticity present This is variable and, if severe, a good result will not be obtained Training in relaxation is necessary Heat is valuable in assisting the relaxation of muscles

Assisted movement is always necessary

at first It is valuable in retraining the patient in control The patient needs training both in the sensation and performance of movement Overeffort is to be avoided and a little movement by the patient without spasm is better than an effort which results in the contraction of unrelated muscles Overaction of the flexor muscles is to be avoided The patient must be instructed to carry out the movements as frequently as possible with relaxation and it is better to train some member of the family to assist him than to attempt to have the technician carry out all the treatment Assisted exercises should be given for all muscle groups of the hands and should be continued until such time as the patient can carry out a little movement of each joint accurately with little tendency to spasm Occupational therapy, under the supervision of some one who understands the problem, is particularly valuable for the later stages of development

Massage of light stroking type is of some value in producing relaxation when the patient is having difficulty Massage has little other value in the treatment of this condition Passive movement is of little value and electrical stimulation in the presence of any degree of spasm is contraindicated

Hand Injuries Due To Compression

This hand condition is seen in women following injury with an electric clothes wringer, and occasionally in men after industrial accidents of a similar nature If complicated by laceration or fracture, adequate surgical care is necessary If no laceration occurs, and x-ray is negative for fracture, the hand is frequently badly neglected Regardless of the above complications, these injuries are primarily soft tissue injuries and are serious

The first-aid care usually received is poor The hand frequently is plunged into a basin or pail of hot water in a dependent position This promptly increases the hemorrhage and edema The hand should be elevated and cold applications applied Under the latter treatment, swelling will be reduced to a minimum Splints should be applied and the hand put in the position of rest Any constriction should be carefully avoided and the elevated position either in a sling or pillow should be continued

At the end of forty-eight hours, active treatment can be undertaken Heat can be applied and radiant heat and light, or a paraffin bath are satisfactory Either can be repeated two or three times a day and should be followed by massage Light and deep stroking massage is satisfactory and should be given carefully Frequently light stroking massage is all that will be tolerated over the area of greatest injury Around this area, deep stroking massage will be tolerated and will be beneficial It should be carried up well over the forearm and special attention should be given to the palmar spaces and the ligaments in the region of the wrist The dorsum of the hand may appear more alarming but fixation of the palmar tendons and damage to the intrinsic muscles is more serious The fingers require special attention particularly in the region of the joints

Active movement up to the point of causing pain is indicated Care should be taken that all joints are moved and so far as possible, that all muscles participate in the movement The exercises outlined under Group I are suitable

The patient must be instructed and trained to carry out these movements for himself They should be repeated at regular intervals, six to eight times a day, preferably with the arm well elevated The necessity for early active movement must be stressed It need not be carried to the point of causing pain but should be insisted upon Late treatment is time-consuming and not as productive of satisfactory results as a small amount of early treatment Resisted movement is frequently valuable It is useful for patients who are afraid of pain The use of resisted movement will induce them to undertake more active movement and some member of the family can be instructed in the application

Obstructive Edema of the Hand

This occurs from obstruction of lymphatic or venous return from a variety of causes, and particularly from injuries and lesions involving the elbow and shoulder There is evidence of an associated compression of the nerves If neglected, it

results in stiffness of some of the joints of the fingers or hand and is very resistive to treatment It is frequently neglected because attention is focused on the cause of the obstruction and the seriousness of the involvement of the hand is overlooked Some active measures should be taken to prevent the stiffness of the hand Elevation and the avoidance of constricting bands are important

The use of radiant heat and light, with radiation of the whole arm, and the anterior and posterior chest, is of value in opening up the superficial channels The application of heat should be prolonged for a considerable part of the day

Massage should be given for as much of the arm as is available for treatment Deep-stroking massage carried from the finger tips well up the arm may be followed by kneading, particularly of the large muscles of the forearm Friction and passive movement may be added particularly to the fingers and hands in the same manner as that noted under Group I

When the edema has been reduced with heat and massage, active exercise should be given Preferably this should be carried out with the forearm elevated on a pillow Exercises should be given as resisted exercise, and squeezing type of movements are particularly valuable It is necessary to see that all movements are carried out and exercises should be repeated at regular intervals, several times a day If active movement is carried out properly, passive movement is seldom necessary

Summary

1 A system of exercises for the hand muscles based on an anatomical consideration of joint movement is presented

2 Lower motor neurone paralysis of the hand muscles is discussed, including treatment of trophic and motor changes

3 Upper motor neurone lesions are similarly discussed

4 Treatment of compression injuries is discussed with emphasis on the necessity of early treatment

5 Obstructive edema is considered and the necessity of active treatment in addition to the treatment of the causative lesion is stressed

MERCY KILLING DE LUXE

Advocates of euthanasia have formed an American group with a membership impressive for its respectability and eminence It calls itself the National Society for the Legalization of Euthanasia On its advisory board are such prominent Englishmen as Havelock Ellis, Julian Huxley, the Earl of Listowel and H G Wells

The founder of this outfit says that the group expects bitter opposition from medical men, who "may bring up their Hippocratic oath (dated 400 B C)" He also says "But common men and women faced with the practical problems of whether or not they will let their loved ones suffer torment for months before death, will cut through all this ancient red tape and somehow make it possible to do the decent and right thing"

"Most of the arguments against euthanasia are founded on emotion rather than reason" We suppose, remarks the *Medical World*, that no emotion will enter into the contemplation of wealthy aunts and dependent mothers-in-law, nor into any machinations to bump them off We suppose, indeed, that no emotion enters into the ideas and efforts and utterances of this much irked group

As to the mere age of our Hippocratic oath serving to discredit and nullify it, isn't this dangerous boomerang logic? The Sermon on the Mount itself is practically as old, with all its "ancient red tape," to wit *Ye have heard that it was said by them of old time, Thou shalt not kill, and whosoever shall kill shall be in danger of the judgment* By the same token one could sever oneself from all sorts of religious obligations faiths and creeds Should we do this? If we are really sincere and prepared to take such steps why not be honest and call our group the National Society for Cultural Murder?

TRAUMATIC LESIONS OF THE OPTIC CHIASM

Report of Two Cases

ELDRIDGE H CAMPBELL, M D and EDGAR WHITE, M D, *Albany*

From the Department of Surgery of the Albany Medical College

Bitemporal hemianopsia, indicating a lesion of the optic chiasm, has very infrequently been reported to follow cerebral concussion As late as 1935, Traquair, Dott, and Russell[11] were able to collect only twenty-seven authentic cases, to which three of their own were added We have had the privilege of studying two patients with chiasmal lesions following head injuries, and since our conception of the underlying pathology does not conform with that of most writers, it would appear that our observations might be of sufficient interest to record

CASE 1 (Seen through the courtesy of Dr Albert Greene) C M, a thirty-three year old steeplejack, fell approximately fifty feet and was admitted to the hospital immediately (August 13, 1935) He was unconscious and was bleeding from the mouth, nose, and left ear The right pupil was contracted, the left dilated, and neither reacted to light. Marked edema and ecchymosis of the left orbit and left subconjunctiva were observed The deep reflexes were not obtainable The temperature was 99 6, pulse 112, and respirations forty, blood pressure was 160/50 The coma gradually lightened and after thirty-six to forty-eight hours he became responsive Drowsiness and disorientation persisted for the next four or five days, after which his mind became quite clear The temperature, pulse, and respirations then returned to normal, the blood pressure has since remained about 120/60

Polyuria and polydipsia appeared soon after the accident and persisted for several months

X-rays of the skull, (Fig 1 and 2) disclosed a vertical line of fracture in the left frontal region approximately five cm long A shorter horizontal crack was demonstrable running above the left orbital ridge. No fracture of the base of the skull was seen There was a fracture of the left clavicle and scapula, and of the third fourth, fifth, and eighth ribs on the left side

Soon after regaining consciousness he complained of blurred vision and diplopia For some days objects appeared to have no color Rough testing disclosed a bitemporal hemianopsia The vision in the left eye was much weaker than that in the right. Gradually the sight improved, and at the end of three or four weeks he could distinguish colors

Perimetric examination of the visual fields (Fig 3) by Dr Greene two months after the accident, revealed a bitemporal hemianopsia There was, in addition, some involvement of both lower nasal quadrants and of the upper nasal quadrant on the left

The fixation point was transected on the left, while on the right it was spared by two or three degrees Two small islands of vision were discovered in the right lower temporal quadrant The visual acuity was 20/15 on the right and 20/70 on the left

Examinations at frequent intervals during the past twenty months have disclosed some widening of the visual fields (Fig 4) Vision in the left eye has markedly improved and has been determined to be 20/40, and on one occasion, 20/30 The small islands of vision in the right lower temporal quadrant persisted about four months and then disappeared

The optic discs are rather pale. They are not edematous and their margins are clear-cut. The retinal vessels are not remarkable The left pupil remains dilated and reacts slowly to light and on accommodation

The right pupil reacts normally Wernicke's hemianoptic pupillary reaction is not demonstrable in either eye The extraocular movements are normal and there is no nystagmus

The patient's general condition is now excellent, he has no headaches nor vertigo Occasionally, for periods of six to twelve hours, polyuria and polydipsia return, but these attacks are becoming less frequent. Before the accident, he weighed 155 pounds During his illness he lost thirty pounds but now weighs 165 pounds There has been no abnormal drowsiness He has returned to work

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester May 25, 1937

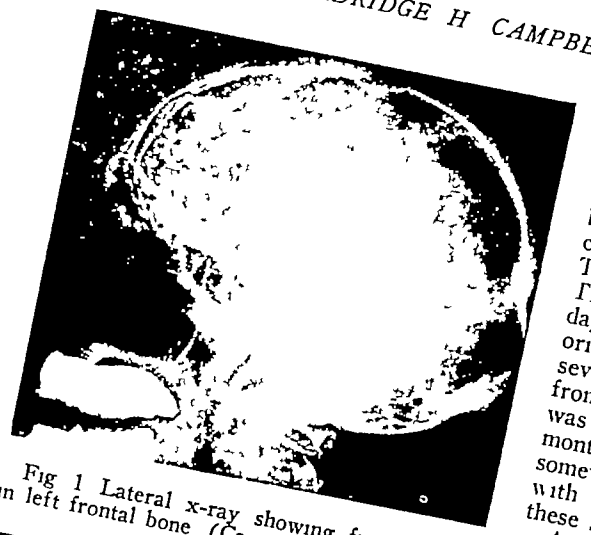

Fig 1 Lateral x-ray showing fracture lines in left frontal bone (Case 1)

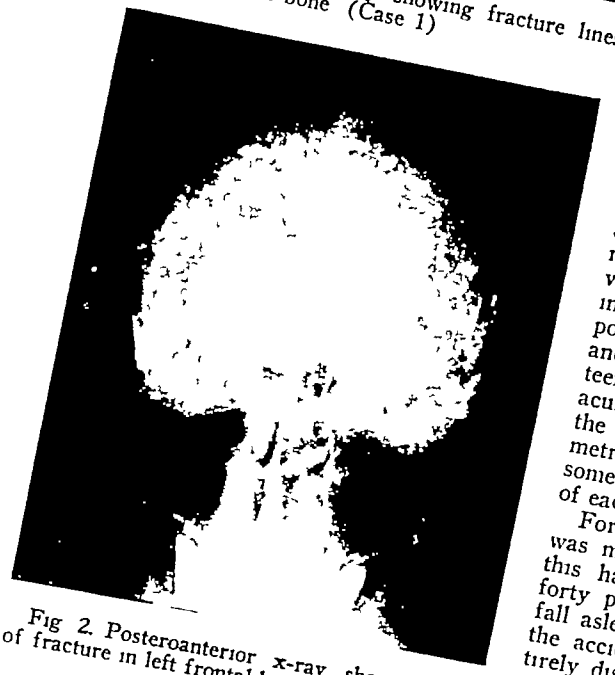

Fig 2 Posteroanterior x-ray showing lines of fracture in left frontal bone (Case 1)

CASE 2 (Seen through the courtesy of Dr A B Van Loon) W P, a forty-two year old white man, was injured in an auto mobile accident (March 12, 1936) and brought at once to the hospital He was comatose for approximately twelve hours There was a long laceration of the forehead. The stupor gradually lessened but for several days was followed by restlessness and disorientation X-rays of the skull disclosed several meridional lines of fracture radiating from the frontal region No basilar fracture was demonstrable (Fig 5-7) For some months after the injury he was irritable, somewhat dispirited, and difficult to get along with Gradually, during the last few months, these symptoms have disappeared

As soon as consciousness was regained, he complained of dimness of vision and diplopia Rough testing disclosed a complete bitemporal hemianopsia Two weeks later this finding was confirmed by Dr Prescott Brown's perimetric examination (Fig 8) Wernicke's hemianoptic pupillary reaction was demonstrable in each eye. The visual acuity was 10/100 in the right eye and 5/100 in the left. The external rectus muscle was partially paralysed Macular vision was spared in the right eye, while in the left, the line cut through the fixation point The optic discs were each quite pale and there was some loss of outline Fourteen months after the accident the visual acuity had improved until it was 20/30 in the left eye and 20/40 in the right Perimetric field tests (Fig 9) then disclosed some filling out of the upper temporal field of each eye, particularly the left

For some time after the accident there was moderate polydipsia and polyuria, but this has entirely ceased He has gained forty pounds in weight, and is inclined to fall asleep a little more readily than before the accident The diplopia has almost entirely disappeared and he has no headaches or other complaints The libido has somewhat diminished He is able to carry on his business

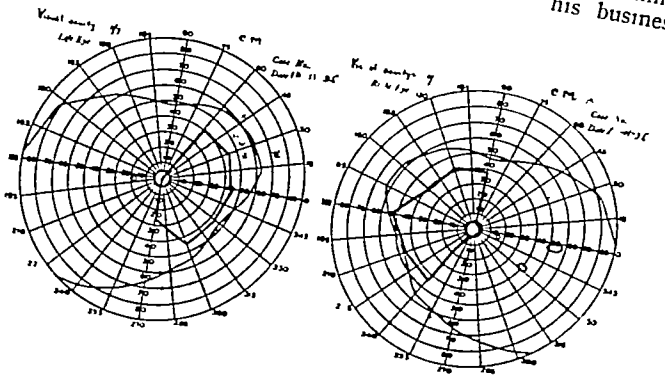

Fig 3 Visual fields (By Dr Greene) two months after injury showing bitemporal hemianopsia with sparing of macular vision on right, and two small islands of vision in right lower temporal quadrant Test object White 5/330 (Case 1)

Discussion

It is indeed strange, that despite the great number of head injuries which have occurred during and since the war, so few instances of trauma to the chiasm have been recorded Several authors, in commenting upon this fact, have suggested that the condition must have been overlooked With this point we are inclined to agree, although it must be admitted that this complication is, to say the least, unusual

The principal features of the syndrome have been ably summarized by Traquair, Dott, and Russell [11] In general, the injury has been a violent one, most often in the frontal region The subsequent duration of unconsciousness has varied from a few hours to several days As might have been expected, the majority of patients showed signs of other brain injury Cranial nerve palsies, particularly of the olfactory, oculomotor, and abducens nerves occurred frequently Subsequent adiposity and diabetes insipidus, indicating damage of the hypothalamic mechanism were observed on several occasions

Visual changes In most instances, the extent of the bitemporal hemianopsia and of the loss of visual acuity have been maximal when first observed Some pallor of the optic discs has usually followed Wernicke's hemianoptic pupillary reaction was observed in many instances Varying degrees of recovery have been the rule Behr's[1] patient, who had a bitemporal hemianopsia with sparing of the macular fibers, gradually improved until eventually the visual fields had completely filled out and the acuity had become normal Usually, however, the recovery has been far from complete, leaving be-

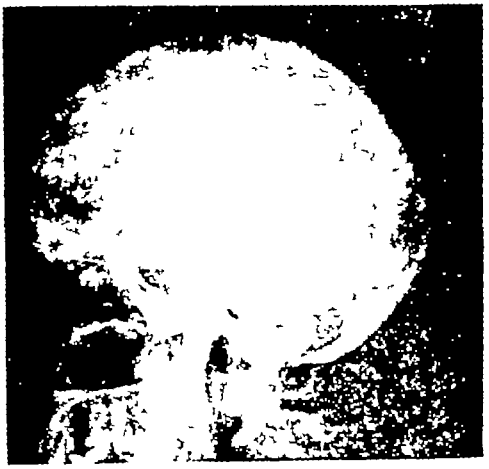

Fig 5 Lateral x-ray of skull showing extensive comminuted fracture in frontal region (Case 2)

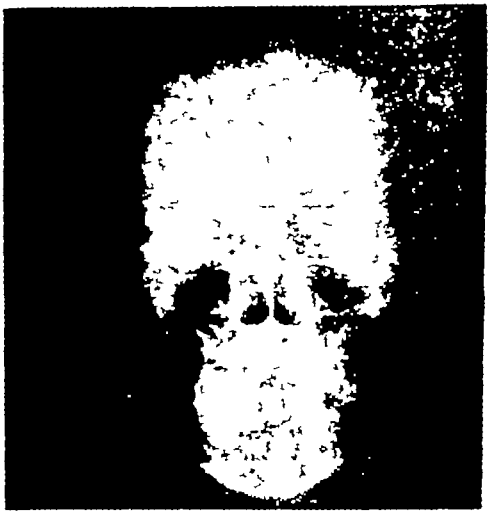

Fig 6 Posteroanterior x-ray showing meridional lines radiating from comminuted fracture in frontal bone (Case 2)

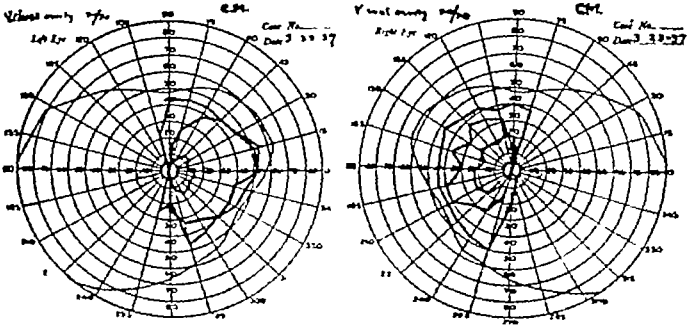

Fig 4 Visual fields twenty months after injury showing some improvement Note that two small islands of vision in right lower temporal quadrant have disappeared Test objects White, 10/330, 5/330 and 2/330 (Case 1)

hind permanent visual defects In one or two instances, the visual loss has actually been progressive, as in the cases reported by Peretti[8] and by Dufour and Gonin[4] In both of our patients, there has been definite widening of the fields and such marked improvement in the visual acuity that they were able to return to work

Pathology Since none of these patients has come to autopsy, or has, until recently, been operated upon, the nature of the lesion has remained a matter of conjecture, albeit a most interesting one It

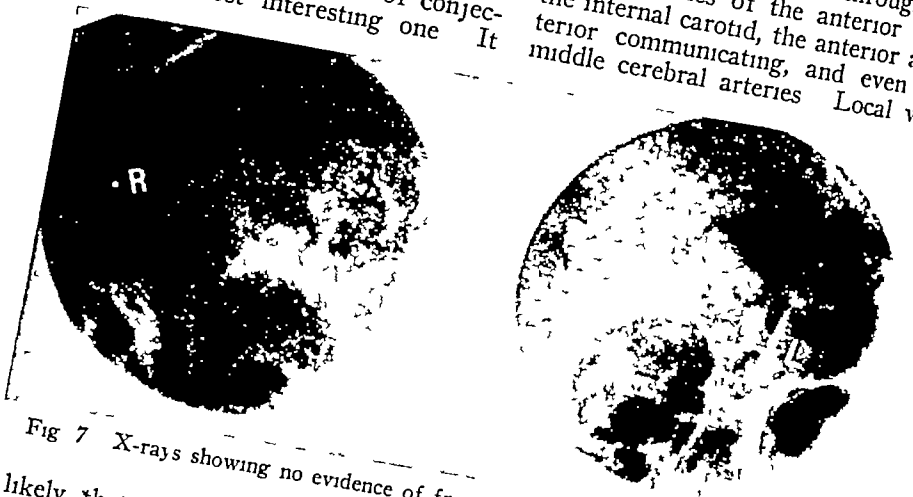

Fig 7 X-rays showing no evidence of fracture traversing either optic foramen (Case 2)

seems likely that the actual mechanism may not be the same in all cases

That a splinter of bone or a fracture which traversed the optic groove caused the damage was suggested by earlier writers Against this assumption was held the fact that neither such change was roentgenologically demonstrable in several cases Furthermore, it was recalled that the optic chiasm actually lay above and behind the optic groove and was separated from the bone by several millimeters of cysternal fluid On the other hand, it is well-recognized that many fractures of the base of the skull are not readily shown by the roentgenogram Recently, Fincher[5] observed a small scale of bone driven into an optic nerve by a head injury The fragment had not been demonstrable in the x-ray This theory, therefore, cannot be entirely discarded and will be referred to subsequently

Constriction of the chiasm by a post-traumatic arachnoiditis is theoretically possible, but does not fit in this clinical picture Such changes would take place slowly, while those observed in these patients will appear immediately following the accident

Terrien,[10] and particularly Traquair and his associates,[11] have advanced the idea that the chiasmal damage was brought about through rupture of its nutrient blood vessels The blood supply of the chiasm is derived through several small branches of the anterior cerebral, the internal carotid, the anterior and posterior communicating, and even of the middle cerebral arteries Local vascular accidents resulting in ischemia or small hematomas might well account for the damage of the crossing fibers

If the lesion is due to the chance rupture of one or more of these tiny vessels, it is indeed curious that those supplying the macular fibers are generally spared while those in the anterior part of the chiasm, corresponding with the inferior nasal quadrants of the retinae, are the first affected

Coppez[2] advanced the theory (accepted by Rand[9]) that the chiasmal lesion is a tear brought about by traction through the optic nerves Liebrecht[7] actually found such a lesion in the chiasm of a patient who died following a head injury * In further support of his theory, Coppez was able to demonstrate on the cadaver that a sagittal fracture through the center of the anterior fossa could produce such a chiasmal lesion The optic nerves, be-

* Since this paper was submitted, a similar case has been reported by C W Rand, *Bull Los Angeles Neurol Soc*, page 91, June 1937

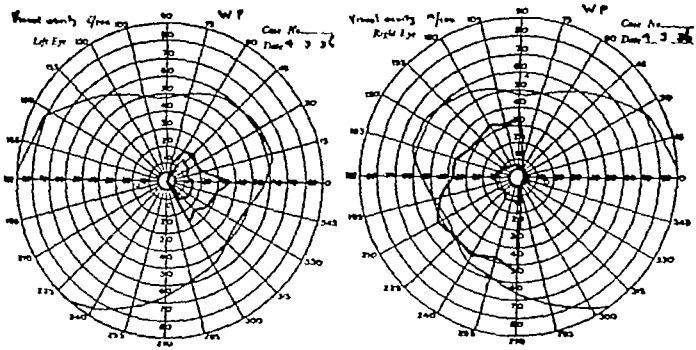

Fig 8 Visual fields (by Dr Brown) three weeks after injury showing bitemporal hemianopsia with partial sparing of macular vision in right eye. Test objects, White and Red, 5/330 (Case 2)

ing anchored at the optic foramina, were made more and more taut as the width of the fracture increased The chiasm was pulled forward, then invariably began to tear along its anterior border Coppez considered this solution adequate to explain the clinical pictures commonly observed It would account for the fact that the fibers in the anterior chiasm are apparently the first affected, and further, that the macular bundles are usually preserved The forward displacement of the chiasm might produce the hypothalamic injury which is often associated The chief objection to this theory has been that no such prerequisite fracture has been customarily demonstrable in the roentgenogram However, Coppez would explain this apparent inconsistency by recalling the natural elasticity of the skull [6] It is suggested that a momentary increase in the transverse diameter of the skull, which, because of its violence and suddenness, need be only a few millimeters to tear the chiasm Perhaps, after all the fact that most of these lesions have appeared in younger people with more resilient skulls, may be of some significance Again it should be recalled that basilar fractures are frequently not demonstrable on x-ray examination

When considered in the light of our personal experience it seems possible that this theory might account for the visual changes in our first patient (Case 1) but not in the second (Case 2) In the latter the extensive recovery of the right upper temporal quadrant, in the presence of very little improvement in the lower temporal field, does not appear consistent with the conception that the lesion is due to the stretching or tearing principally of the anteriormost fibers of the chiasm

One final possibility remains to be considered, that of intrasellar hematoma Could such a collection of blood distend the diaphragm sufficiently to compress the chiasm? The answer is definitely in the affirmative The most important contribution to the solution of this problem has come from Dr W P Van Wagenen [12] He has operated upon two patients with bitemporal hemianopsia following head injuries and has successfully evacuated hematomas from within the sella in each instance

It is indeed fortunate that Dr Van Wagenen and Dr Garvey are in the

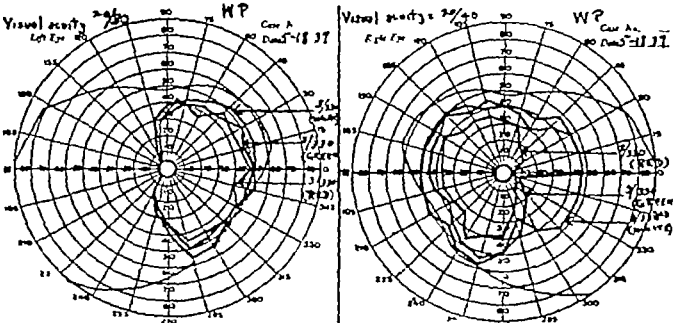

Fig 9 Visual fields fourteen months after injury showing definite improvement in both eyes (Case 2)

audience and can give us the details of these highly important cases

Traquair and his associates[11] pointed out the fact that not infrequently the visual changes both appear and recede in the same order as those commonly associated with pituitary adenomas, that is, that the upper temporal fields tend to go first, the lower temporal second, the lower nasal third, and the upper nasal quadrants last This progression of changes was not definitely observed in our two patients In Case 1, the areas of temporal vision which returned were so slight as to be inconclusive, in Case 2 on the contrary, the principal recovery took place in the (right) *upper* quadrant and much less in the (right) lower temporal quadrant. There has been no convincing evidence, such an enlargement or erosion of the sella or progressive loss of vision, that such a lesion was the cause of the chiasmal damage in either of our patients In both, the visual acuity and the visual fields have steadily improved and there have been no headaches, nor have subsequent x-rays (at least in Case 2) disclosed any evidence of enlargement of the sella turcica or atrophy of the clinoid processes However, this by no means excludes the possibility that the chiasmal damage in these two patients was not brought about through intrasellar hematomas, and that their gradual absorption was responsible for the visual improvement which occurred

An interesting, though not strictly comparable example of this condition has been described by Dandy[8] The patient had had previous visual disturbances and was known to have a pituitary tumor Blindness followed severe head injury At operation a huge intrasellar hematoma was found associated with a small chromophobe adenoma of the hypophysis

It appears likely, therefore, that on occasion the bitemporal field defects which follow head injuries may well be explained upon the basis of intrasellar hematomas It cannot be denied that the chiasm may, in some instances, be injured directly, as by a tear or an intrinsic vascular accident Although visual improvement generally occurs, as it fortunately has in our patients, we would conclude that surgical exploration of the optic chiasm, particularly if the visual cases be progressive, should be seriously considered as soon as the patient's condition permits It is felt that the ultimate visual defects might be less when the hematoma, if present, is evacuated early

Summary

1 Two cases of bitemporal hemianopsia following head injury are reported

2 The theories regarding the possible nature of the chiasmal lesion are discussed

3 It is concluded that since, at least in certain instances, intrasellar hematomas have been present, early surgical exploration of the optic chiasm is sometimes indicated

Discussion

Dr. Conrad Berens, *New York City*—The question of the cause of bitemporal hemianopia in severe cerebral trauma is a most important one. However, because of the way in which the nerve fibers of both eyes spread out into the chiasm it seems to me that each case must be studied individually

In most of these cases one must seriously consider the question of laceration or other traumatic injuries to the chiasm as well as the resulting edema of the surrounding tis-

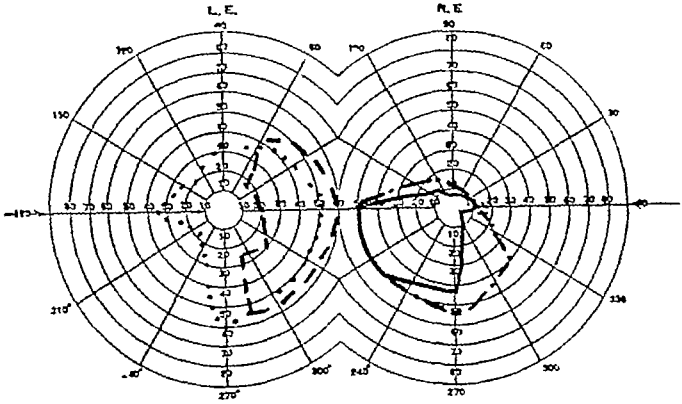

Fig 1 Bitemporal hemianopia following cranial injury Visual field for form of right eye using three mm. test object March 6, 1931, — —, October 20 ——— Visual field for light of left eye March 13, 1931, , August 7 — — —

sues in addition to the question of compression by a hematoma.

In a case observed by me, (details of which are given below) through the courtesy of Dr Bryon Stookey, we concluded that because of the final gradual improvement in vision, hemorrhage and edema had played some part in the bitemporal hemianopia However, we were convinced that actual destruction or compression of the nerve fibers of the chiasm were the most important factors in the picture

N S., female, married, was examined on December 13, 1930 The following diagnoses were made Bitemporal hemianopia, contusion of eyeball, right eye, rupture of the choroid, hemorrhages in vitreous, traumatic paralysis of the left lateral rectus, fracture of the skull, and on May 22, 1931, Argyll Robertson pupil, right eye.

On December 8, Mrs S had been in an automobile accident and was struck in the right frontal region by a long pole, which extended from the rear of a truck. The patient had a depressed fracture of the right frontal bone accompanied by contusion of the right eyeball with rupture of the choroid and massive vitreous hemorrhages

When I saw her (five days after the accident) she had a bitemporal hemianopia, complete in the left eye and partial in the right eye (Fig 1) The field in the right eye was contracted almost to the fixation point and the field in the left eye gradually contracted so that she could only distinguish light in the upper nasal field Both nerves were extremely pale and atrophic, and ptosis of the left upper eyelid was present. At the first examination, the left eyeball showed marked protrusion which gradually subsided On March 27, 1931, she was able to raise the left upper eyelid approximately three to four mm but there was only slight ability to rotate the left eyeball Her vision without correction in the right eye was 20/50+1

On March 20, 1931, vision in the right eye with the following correction +.25 sphere was 20/40, with a +75 sphere added the near point of accommodation was 170/700 mm.

On December 2, 1932, the field of rotation charted on the tropometer was right eye 40° temporal, 32° nasal, 40° above, and 40° below, left eye 10° temporal, 30° nasal, 10° above, and 20° below

On December 17, 1932, an eight mm. resection of the left superior rectus was performed as well as a ten mm resection of the left lateral and stretching and partial tenotomy of the left inferior rectus

On March 3, 1933, the eyes were comfortable Vision in the right eye was 20/40 and the near point of accommodation was 160/300

ENTERING THE ERA OF IRRESPONSIBILITY

If socialized medicine is best for the people, the physician will be obliged to bow to it, but it may be predicted with all confidence that if that day arrives, it will be through a leveling process that has taken individual incentive, enterprise, ambition and triumph out of the hearts of all our people and forced us into the leaden rhythm of the State's blighting goose step

There are definite and disturbing signs that self-reliance is on the way out We are taking soundings in the era of irresponsibility The extent to which, as a nation, we enter it, inevitably to pass later into its sure successor the era of despair, depends in no small measure upon the haste and abandon with which we experiment with such nostrums as state medicine

Of course, it is possible for America to change its fundamental law as embedded in its traditions and written in the Constitution so as to put the entire medical profession into the public service, but the conclusion is inescapable that in addition to numberless other evils, this will produce a vast army of malingerers and hypochondriacs It can be done, but it is not the American way —*L L Bomberger, Pres of the Ind State Bar Assn, in the Jour of the Ind State Med Assn*

HYDROA ESTIVALE IN CONGENITAL PORPHYRIA

In a Case With Purplish Brown Teeth and Hirsuties

CLARENCE H PEACHEY, M D, KONRAD DOBRINER, M D, and WILLIAM H STRAIN, Ph D, *Rochester*

From the Department of Medicine and the Department of Biochemistry and Pharmacology, the School of Medicine and Dentistry, The University of Rochester

In the latter part of the summer of 1935 an eighteen months' old child with hydroa estivale was seen by one of us Shortly thereafter the detection of large amounts of porphyrins in the urine and feces revealed that the patient had the rare fault of pigment metabolism known as congenital porphyria In this preliminary report the case history is presented together with some of the results of chemical investigation and treatment A brief review of the literature and a discussion of the terminology and etiology of the disease are included

Case History

Family history The patient is one of two children The mother has had only two pregnancies, both of which were normal The other child, a blond boy nine years of age, is in good health Detailed family history going back two generations fails to reveal any relative with symptoms similar to those of the patient * The urinary porphyrin content of each of the other immediate members of the family has been found to be normal

Case history V B, a white female child, was born at the Rochester General Hospital on April 10, 1934 with a normal delivery

Immediately after birth reddish-brown stains were noted on the diapers, and the urine is reported to have been of a similar color Tests for blood in the excreta have always been negative

During the summer of 1934 the child was exposed to the sun on numerous occasions, and no sequelae were noted In November, at the age of seven months, the first tooth appeared It was purplish-brown in color and each succeeding tooth was more or less similarly pigmented The first skin manifestations—a blister on the bridge of the nose—appeared when the child was fourteen months of age During the summer of 1935 similar lesions developed on the face and the back of the hands especially after exposure to the sun The mother states that blisters formed, remained for four or five days, and then crusted After a few days the crust came off and slightly scarred pinkish spots remained At this time the mother consulted a physican who made a diagnosis of impetigo Therapy was without effect, however Shortly thereafter vesicles appeared under the nails of both index fingers, and subsequently the nails fell off The child has always bruised easily and the bruises healed slowly, leaving superficial scars which persist for many weeks The remainder of the history since birth is negative, save that during the first year of life the child vomited nearly every day, at present she vomits occasionally

Our first contact with the case was on September 20, 1935, when the baby was brought in for treatment At that time the child presented pink and red lesions ranging in size from a small pea to a ten-cent piece The lesions were present on the backs of the hands, on the forehead, on the bridge of the nose, on the cheeks, and around the mouth and chin The red patches on the face showed typical varioliform type of scarring There were four or five thick-walled conical vesicles, some of which had ruptured and had formed crusts with an inflammatory base Both index finger nails had been lost and excessive growth of hair was present on the arms and legs All the teeth were purplish or reddish-brown in color (Fig 1)

*We are indebted to Dr Robert C Robb for the Genealogical study

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

A diagnosis of hydroa estivale was made at the first examination and subsequently spectroscopic inspection of the urine and feces revealed large amounts of porphyrin When examined under ultraviolet light, the teeth fluoresced red

Physical examination (September 1935) The child is well-developed and well-nourished and does not appear to be ill She is uncooperative and resists examination of any kind. *Head* The head is normal in size and shape. The hair is abundant and copper-red in color *Eyes* The pupils are equal, round and regular, and react to light The conjunctivae are injected *Ears* (not examined) *Nose* The mucous membranes are injected and are covered with some mucopurulent discharge *Teeth* The teeth are purplish or reddish-brown in color, but the pigmentation is not uniform and there are occasional small areas which are nearly white *Neck* There is no rigidity or adenopathy of the neck *Chest* The chest is well-developed and symmetrical The respirations are normal *Lungs* The lungs are normal to percussion and auscultation *Heart* The heart is normal to percussion and no murmurs are heard *Abdomen* Although slightly distended, the abdomen shows no apparent tenderness or muscle spasm The liver, kidneys, and spleen are not palpable. The genitalia are those of a normal female infant *Extremities* The extremities are symmetrical and stocky Hair is abnormally abundant on the extremities, especially on the legs There is no clubbing of fingers or cyanosis of the nail beds Edema of feet or ankles is absent. *Reflexes* The reflexes are active and equal *Skin* (See history)

Second physical examination (July 1936) The patient is very well-developed (2½ years old) weighing 16 9 Kg, and does not appear to be ill or in any distress, the rectal temperature is 37 6°C She is alert, friendly, and cooperative to a certain degree The skin has a good color and turgor, and is smooth and dry There is a considerable amount of hair on the arms and legs The hair of the scalp is soft and a vivid copper-red in color The nails are normal Several small bleb-like lesions four-six mm in diameter are present on the backs of the hands Some of these have ruptured and new skin is apparent at the base, the lesions are shown in the photograph of the hands (Fig 2)

There are many areas of sharply demar-

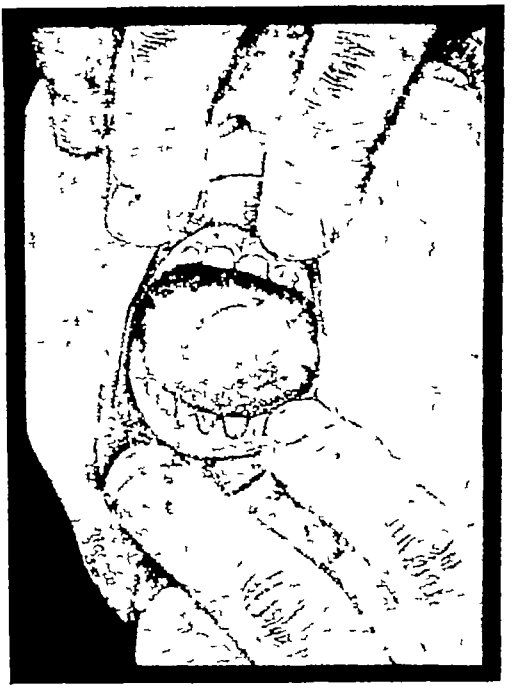

Fig 1 Pigmentation varies from purplish-brown to a reddish-brown color Note erythematous lesions on cheeks

Fig 2 Note blisters on middle and small fingers of right hand and scars of previous blisters on backs and knuckles of both hands

cated erythema one-two cm in diameter on the face in the region of the nose and cheeks (scars of previous blebs) The mucous membranes are normal No enlargement of the nodes is present The patient stands and sits erect and there is no evidence of gross skeletal abnormality The head is symmetrical and well-formed The sclerae and conjunctivae are clear The external ocular movements are normal The pupils are equal and react to light The fundae appear normal The eardrums are clear The teeth, 8/8, are well-formed and purplish-brown in color The gums and tongue are normal, the pharynx is clear, and the tonsils are enlarged The neck is supple and there are no masses present, the rachea is in the midline The chest is symmetrical with good expansion and the costochondrial extensions are normal The heart is normal, pulse, 100 The lungs are clear to percussion and auscultation The abdomen is slightly protuberant but soft. The spleen is enlarged and palpable one-two cm below the left costal margin The edge of the spleen is firm and regular The liver edge is palpable four-five cm below the xiphoid and two-three cm below the right costal margin in the midclavicular line The edge is firm, smooth, and not tender The genitalia and anus are normal There is no peripheral edema Neurological findings are negative save that the reflexes are hypoactive

Radiographs A-P and Lat of Knee Joint (November 1935) The general bony contours appear normal The metaphyseal region shows a broad line of increased density on the shaft side of the epiphyseal line This is the only unusual change noted at this examination Ant post and lateral views of both wrists show changes of a similar character at the distal ends of the radius and ulna The trabeculation of bone in the metacarpals and phalanges appears regular At the right fifth metacarpal the shaft appears broadened, with a thin cortex and small oval shadows of decreased density within it, suggesting small cyst-like areas of degeneration (Dr W W Fray)

Stereos of sella turcica (May 19, 1937) The sella turcica is very small The anterior and posterior clinoids approximate each other, but do not fuse. The markings on the inner table are slightly prominent The bone of the table of the anterior portion of the parietal bone on the right side appears increased in density The outer table is normal (Table I)

No abnormality of the sella is present There is apparently an old injury at the anterior right parietal bone (Dr L A Mucci)

Summary of Case History

A 3-year old red-haired girl with hydroa estivale due to congenital porphyria presents the following clinical features During the spring and summer characteristic skin lesions develop which soon heal leaving permanent scars The urine is red to Burgundy-red in color The teeth are stained purplish or reddish-brown Precocious physical development and the presence of large amounts of hair on the extremities of the child indicate that a glandular disturbance is one of the factors involved in the disease Radiographic examination shows that cystic changes are present in the ends of the long bones Apart from these symptoms the findings of the physical examination and the blood picture are essentially normal

Hydroa Estivale (or Vacciniforme)*

Cutaneous manifestations such as those which are present in our case have been reported frequently since 1862 when Bazin[1] gave the first description of hydroa vacciniforme It was not until

*The terms are used interchangeably here as is done in most of the literature It might be well to reserve each term for a definite condition. Senear and Fink[2] have suggested that cases without scarring should be designated as hydroa estivale, cases with scarring as hydroa vacciniforme

1898, however, that Anderson[2] in two cases of hydroa estivale in brothers, suggested a possible relationship between the excretion of porphyrins and the condition of the skin. The cases that are described in the literature have often been discussed either with respect to the excretion of porphyrins, to photosensitivity, or to both phenomena. Summaries of these cases were published by Günther[3] in 1912, Senear and Fink[4] in 1923, Mason[6] in 1933, Gottron and Ellinger[5] in 1932, and by Mathews[7] in 1937. The last-named author surveyed fifty-seven cases of hydroa estivale that had been described since 1905 and found that only in thirty-two had an examination for porphyrins been made. In twenty-three of these cases porphyrin excretion was increased, but in nine, no increase was noted. It is possible that in the negative cases better methods of examination might have increased the number of positive results. Thus Mason[6] correctly sums up the situation in his review of porphyrins in relationship to disease by stating that hydroa can occur without increased porphyrin excretion and conversely that porphyria does not always produce photosensitivity.

The Porphyrias

The porphyrias are disturbances of pigment metabolism which lead to the increased excretion of porphyrins in the urine and feces. In cases where the level of excretion is very high, the urine is generally the color of Burgundy wine, occasionally, however, the color of the urine is normal even though the porphyrin content is high. Patients affected with the disease present a group of symptoms referable to the skin, the nervous system, or the gastrointestinal tract.

Our knowledge of the porphyrias has come from an extension of the information gained from the study of congenital porphyria with which hydroa estivale is most generally associated. Congenital porphyria has been described by Garrod[8] in many of its clinical aspects as a part of his monograph on "Inborn Errors of Metabolism." The chemistry of these pyrrol pigments has been developed by Hans Fischer[9] and the pathology of congenital porphyria has been summarized by Borst and Königdorffer[10] in their classical study of the famous case of Petry. For several decades the designation hematoporphyria has been used as a group name for the different forms of the disease even after it was recognized that hematoporphyrin is never present in the excreta. Hematoporphyrin is a porphyrin prepared from hemoglobin by the action of strong mineral acids,[11] it has never been found as such in biological material. Therefore this group of diseases is properly described by the term "porphyrias."

Porphyrins are found in nature either combined or free. Examples of combined porphyrins are the iron pigment, hemoglobin, and the green plant pigment chlorophyll. These combined porphyrins, the respiratory pigments, are important to life either as oxygen carriers or as biochemical catalysts. It is noteworthy that usually the porphyrins which are excreted in the urine and the feces are different structurally from those of the respiratory pigments, the urinary porphyrins are generally of the so-called type I, the respiratory of type III. The terms "type I" and "type III" refer to the parent etioporphyrins from which the two types of porphyrin are derived.

The excretion of free porphyrin in the urine and stool is increased in fever and in many of the recognized diseases of blood disorders. The porphyrias are usually classified into four groups:

1. Acute idiopathic porphyria
2. Acute toxic porphyria
3. Chronic porphyria
4. Congenital porphyria

In idiopathic porphyria all of the symptoms are referable to the gastrointestinal tract. The onset is sudden and is characterized by nausea, vomiting, and cramp-like pains originating in the lower abdomen and radiating into the thighs. Affectation of the skin is rarely seen. The course of the disease is acute with fever and the excretion of porphyrins is relatively high.

Where a definite precipitating factor is known, the designation toxic porphyria is appropriate. The symptoms are similar to those of idiopathic porphyria and here again photosensitivity is seldom noted. The usual precipitating factors are lead poisoning and poisoning from the sulfone hypnotics. With lethal termination an

ascending paralysis of the central nervous system is present

In chronic porphyrias abnormal quantities of porphyrin are found in the excreta but the patient is free from symptoms usually associated with porphyria Among the diseases in which chronic porphyria occurs are those of the liver and certain of the blood dyscrasias Photosensitivity is seldom found with chronic porphyria, but skin manifestations sometimes appear late in life.

Congenital Porphyria

The very rare condition of congenital porphyria has been described in about thirty cases Of these Gunther[12] has summarized eighteen cases and Mason[6] has discussed some of the others, but in only ten of these cases have the porphyrins been isolated and characterized Generally one of the first symptoms of this rare disease is the excretion of Burgundy wine-colored urine, this excretion usually begins at birth A second symptom is the development of bullous or erythematous lesions of the skin after exposure to the sun, in true congenital porphyria these lesions appear in the early years of life The eruptions are confined to the exposed regions—the face, the neck, the ears, the backs of the hands, and, in children, the knees and legs In the case of the child reported here lesions have developed only on the face and hands The eruption begins as a slight irritation or redness followed by vesicles or bullae, most of which are filled with clear serum, while others are pustular Central necrosis of the blisters may appear, followed by crusting, healing, and scar formation The scars on the face are of the varioliform type but those on the hands are slightly raised At first they are red, but gradually, over a period of months, they fade and leave permanent scars Repeated attacks result in cicatrization, mutilation of the parts, and loss of substance, especially of the ears, nose, and fingers The exposed portions of the body often become pigmented and the tissue infiltrated and sclerosed as in scleroderma Excessive growth of hair and pigmentation on unscarred portions of the exposed parts have been reported in many of the cases[13] In our case excessive growth of hair is present but pigmentation of the skin has not occurred as yet Since the child has red hair, pigmentation may not develop* The unusual amount of hair on the extremities of the child, together with her precocious physical development (weight, 16 Kg), are suggestive of glandular disorders Similarly, some of the other cases of congenital porphyria present symptoms indicating disturbances of the glandular equilibrium, but the mutations are sufficiently different so that no generalizations can be made

Mackey and Garrod[14] have pointed out that in congenital porphyria the teeth are frequently pigmented and "pink" in color (erythrodontia) In our case the color of some of the teeth is purplish-brown, of others reddish-brown The first tooth, which erupted at seven months, was so stained, and each succeeding tooth was similarly colored This pigmentation is caused by the deposition of the porphyrins as calcium salts, as was demonstrated in the case of Petry[10] Reports on the pathology of the teeth seldom are complete, but in a recent review Garrod[15] gives a ten-year follow-up on three cases of congenital porphyria, one of which had stained decidual teeth and also pigmented permanent teeth That the bones are similarly pigmented has been shown by autopsy material and, in some instances, by transillumination In passing it may be noted that the disease in animals known as ochronosis is a type of congenital porphyria and that pigmentation of the bones is due to deposition of uroporphyrin I[16] These porphyrin deposits doubtless alter the calcium metabolism and, in some of the more severe cases of congenital porphyria, stiffness of the joints and atrophy of the terminal phalanges is seen Indeed the changes are sometimes so severe that the earliest described cases were initially regarded as a variety of leprosy[17]

Shedding of the nails from time to time is a common symptom of the disease In our case both index finger nails have been lost and are regrown This

*This discussion of the pathology of the skin is intentionally superficial We hope to treat the subject adequately in a later publication For a discussion of the pathology of the skin of other cases, see the literature cited in reference 13

condition combined with the cutaneous scarring of the hands and face may lead to pronounced disfigurement Occasionally bullae form repeatedly on the conjunctivae and the cornea, and the lesions thus produced cause blindness

With the passage of time the liver and spleen of patients suffering from congenital porphyria becomes enlarged A slight enlargement has occurred in our case and it is probable that further enlargement will take place as the child grows older Associated with the increase in the size of the liver and spleen are changes in other portions of the reticulo-endothelial system, especially of the bone-marrow There is generally a marked anemia accompanying these changes Like other blood pigment disorders, these changes seem to be cyclical in nature with the result that in congenital porphyria there are periods when the patients approach normal health

Treatment

Treatment of congenital porphyria has been very unsatisfactory and the prognosis is poor, at least as far as the prevention of cutaneous scarring is concerned.

Whether the life span is shortened is difficult to determine, since not enough cases for a statistical survey have been reported in the literature The usual form of treatment has been the utilization of topical protective appliances such as salves or dusting powders containing esculin or quinine salts,[18] the object being to shut out the ultraviolet light A similar result is obtained by the use of veils, umbrellas, etc, and Garrod[19] has suggested that if individuals affected by this diseace should lead a troglodyte existence, most of the skin lesions could be avoided The administration of large amounts of calcium salts has been reported as beneficial in some of the cases,[20] but the results are difficult to evaluate, since quantitative determinations of porphyrin excretion have not been carried out In recent years liver therapy and glandular extracts have been employed

It is known that in untreated conditions of pernicious anemia and of pellagra abnormally high amounts of coproporphyrin I are excreted [21] With the instigation of liver therapy the porphyrin content of the excreta falls rapidly toward normal in these diseases For this reason it appeared desirable to try liver therapy in our case of congenital porphyria * Liver extract has been used by Schreuss and Carrié[22] and others in the treatment of congenital porphyria and by various workers[23] in the treatment of acute porphyria, but in no instance have quantitative measurements been reported during the therapy

Prior to the instigation of liver therapy the porphyrins of the urine and feces of our case of congenital porhryria were identified as coproporphyrin I, which was present both in the urine and feces, and uroporphyrin I, which was present only in the urine There were traces of an ester of coproporphyrin I in the feces and small amounts of unidentified porphyrins in the urine The identification was made by extracting the ether-soluble porphyrins and precipitating the ether-insoluble After purification of the crude porphyrins obtained in this way, final identification was made by means of the melting points of the methyl esters The details of the method are described elsewhere [24]

The daily level of coproporphyrin in the excreta was determined by extracting quantitatively with ether, purifying, and comparing with a standard porphyrin solution in a photoelectric colorimeter The average daily excretion determined in this way was found to be about 9,500 micrograms of which 1,000 micrograms were excreted in the urine This represents about a thirty-fold increase over the daily level of a normal adult, whose fecal output may be taken to be 300 micrograms per day and whose urinary output is approximately fifty micrograms per day [25] Parallel determinations of stercobilin, the fecal end product of the degradation of hemoglobin, showed that the level of hemoglobin metabolism was about 1 5-2 times normal The data which were obtained from a seven-day study are plotted in Chart I

Following the determination of the level of excretion in the untreated condition, liver therapy was instigated over a period of nine days, during which five

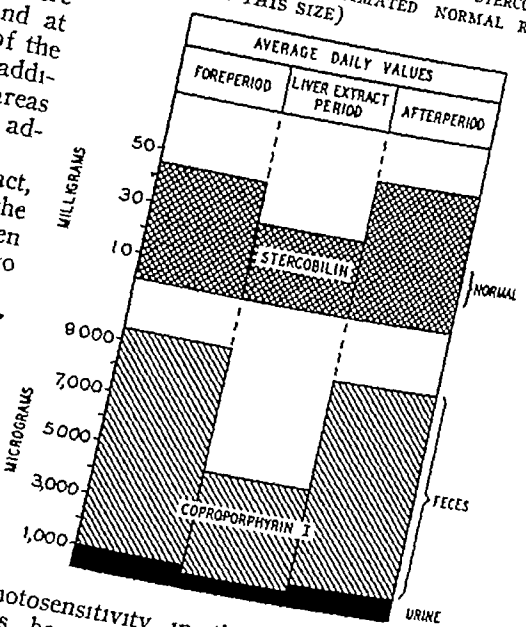
*The study was carried out in the Division of Pediatrics, Strong Memorial Hospital. We are indebted to Dr S W Clausen for this privilege

c c of liver extract was given intramuscularly each day * In this period the average level of excretion dropped to 4,700 micrograms of coproporphyrin I per day, of which the urinary fraction was 600 micrograms In the afterperiod of six days, liver extract was given twice a week, but the level of excretion promptly rose to 8,800 micrograms per day—nearly the same level as that previous to treatment Simultaneous determinations of stercobilin showed a parallel drop in level during the liver period from forty-four to thirty mg per day In the afterperiod the level of stercobilin promptly rose to a value higher than that prior to treatment These values are also plotted in Chart I During the liver therapy the blisters that were originally present healed rapidly and at the end of the period the condition of the skin was definitely improved In addition to a better texture the scar areas were less sharply demarcated from adjoining parts of the skin

Following intramuscular liver extract, the child was given liver extract in the diet This proved to be valueless even when the daily dose was equivalent to 200 Gm of liver

The result of this study of liver therapy may be summarized as follows Apparently there is a principle in liver extract which when given intramuscularly inhibits the formation of type I porphyrins either directly or indirectly It is premature to speculate on the nature of this principle, but the effect is definite

Although the excretion of coproporphyrin I was high during the period following intramuscular liver therapy, the condition of the child was definitely improved In all, six or seven small blisters appeared during the summer, yet the child was active and was exposed to sunlight rather more than was advisable It is possible that this beneficial result was due to a decrease in production of uroporphyrin I which, from experiments on amebas, is known to produce greater photosensitivity than coproporphyrin I [20] Unfortunately we were unable to make determinations of uroporphyrin at the time this investigation was carried out



*Solution Liver Extract Concentrated (Lilly) was used A generous supply of this preparation was placed at our disposal by Dr G B Walden of Eli Lilly and Co, Indianapolis, Ind

Photosensitivity

The physiological porphyrins at the hydrogen ion concentration of the tissues absorb light in the red, the green, the blue-green, the blue, and near ultraviolet The absorption in the near ultraviolet is so much greater than that in the visible that it seems self-evident that photosensitivity due to the porphyrins should be predominately in this region Actually photosensitivity in the near ultraviolet has been demonstrated by Blum and Hardgrave[27] with a child suffering from congenital porphyria, but the physiological response obtained in their case was the production of pigmentation rather than the typical lesions of congenital porphyria In a later work Blum[28] studied the photosensitivity produced by intradermal injections of porphyrin Here a red wheal was obtained on irradiation, but in one instance, six weeks after injection, a response in the form of a nearly typical lesion was noted when the experimental subject exposed himself to high intensity of sunlight

In our case, because of lack of suitable

CHART I—PIGMENT EXCRETION IN CONGENITAL PORPHYRIA (BRACKETED AREA OF STERCOBILIN PORTION INDICATES ESTIMATED NORMAL RANGE FOR CHILD OF THIS SIZE)

light sources and restlessness of the child, we have not studied adequately the photosensitivity in the near ultraviolet. Using contact unfiltered ultraviolet light from a Kromayer lamp, we have found that the skin of this child with congenital porphyria is more resistant than that of normal brunettes. Initial observable erythema was produced by thirty-two seconds irradiation with the brunettes, while the child and a red-haired control showed initial observable erythema at sixty-four seconds. From these observations it is apparent that there is a normal state of resistance to the lower wave length. In the course of our work we have come to the belief that the photosensitivity depends chiefly on the two factors (a) the level of the porphyrin concentration in the tissues and (b) the intensity of light. We are not able to establish this view at present, but hope that further work will clarify the situation.

The term hydroa estivale (or vacciniforme) is a descriptive one of cutaneous manifestations seen in various types of light sensitivty. In this and other cases with porphyria, there is a known exciting factor. Cases of hydroa which do not show porphyria, according to our point of view, must have some other exciting factor or factors which produce photosensitivity, but as yet these have not been demonstrated. Further biochemical and physiological study is necessary to correctly classify these cases as to their etiology.

Summary

1. A condition of hydroa estivale due to congenital porphyria is reported in a three year old girl.

2. The teeth of the child are purplish-brown, and the urine is Burgundy wine color due to large amounts of free porphyrin in the urine. Excessive growth of hair on the extremities and precocious physical development suggest that glandular disturbances are present.

3. This and similar cases should be described by the term congenital porphyria rather than hematoporphyria, since the porphyrin excreted is never hematoporphyrin.

4. The effect of liver therapy on the excretion of porphyrin was determined. Although the level of excretion is greatly decreased during treatment, it returns to the original level after cessation of liver therapy.

5. Experiments on photosensitivity were inconclusive due to noncooperation on the part of the child and the lack of suitable light sources. The child is more resistant to unfiltered ultraviolet light (Kromayer lamp) than a normal adult. After liver therapy the tendency to develop blisters is somewhat diminished.

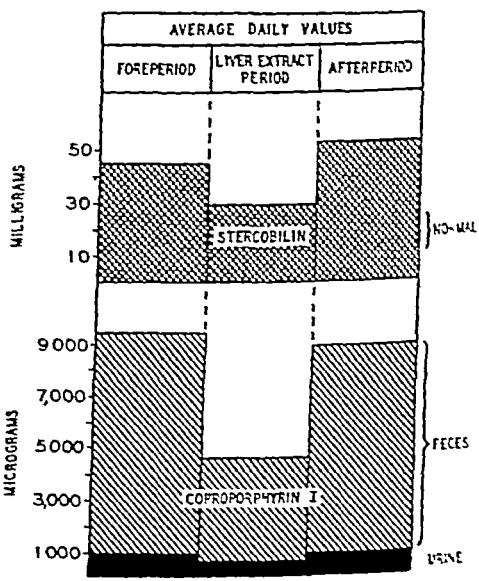
(See next page for discussion by Dr. Louis Tulipan)

c.c of liver extract was given intramuscularly each day* In this period the average level of excretion dropped to 4,700 micrograms of coproporphyrin I per day, of which the urinary fraction was 600 micrograms In the afterperiod of six days, liver extract was given twice a week, but the level of excretion promptly rose to 8,800 micrograms per day—nearly the same level as that previous to treatment Simultaneous determinations of stercobilin showed a parallel drop in level during the liver period from forty-four to thirty mg per day In the afterperiod the level of stercobilin promptly rose to a value higher than that prior to treatment These values are also plotted in Chart I During the liver therapy the blisters that were originally present healed rapidly and at the end of the period the condition of the skin was definitely improved In addition to a better texture the scar areas were less sharply demarcated from adjoining parts of the skin

Following intramuscular liver extract, the child was given liver extract in the diet. This proved to be valueless even when the daily dose was equivalent to 200 Gm of liver

The result of this study of liver therapy may be summarized as follows Apparently there is a principle in liver extract which when given intramuscularly inhibits the formation of type I porphyrins either directly or indirectly It is premature to speculate on the nature of this principle, but the effect is definite.



Although the excretion of coproporphyrin I was high during the period following intramuscular liver therapy, the condition of the child was definitely improved In all, six or seven small blisters appeared during the summer, yet the child was active and was exposed to sunlight rather more than was advisable. It is possible that this beneficial result was due to a decrease in production of uroporphyrin I which, from experiments on amebas, is known to produce greater photosensitivity than coproporphyrin I[26] Unfortunately we were unable to make determinations of uroporphyrin at the time this investigation was carried out.

*Solution Liver Extract Concentrated (Lilly) was used. A generous supply of this preparation was placed at our disposal by Dr G B Walden of Eli Lilly and Co., Indianapolis, Ind.

Photosensitivity

The physiological porphyrins at the hydrogen ion concentration of the tissues absorb light in the red, the green, the blue-green, the blue, and near ultraviolet. The absorption in the near ultraviolet is so much greater than that in the visible that it seems self-evident that photosensitivity due to the porphyrins should be predominately in this region Actually

CHART I—PIGMENT EXCRETION IN CONGENITAL PORPHYRIA (BRACKETED AREA OF STERCOBILIN PORTION INDICATES ESTIMATED NORMAL RANGE FOR CHILD OF THIS SIZE)

photosensitivity in the near ultraviolet has been demonstrated by Blum and Hardgrave[27] with a child suffering from congenital porphyria, but the physiological response obtained in their case was the production of pigmentation rather than the typical lesions of congenital porphyria In a later work Blum[28] studied the photosensitivity produced by intradermal injections of porphyrin Here a red wheal was obtained on irradiation, but in one instance six weeks after injection, a response in the form of a nearly typical lesion was noted when the experimental subject exposed himself to high intensity of sunlight

In our case, because of lack of suitable

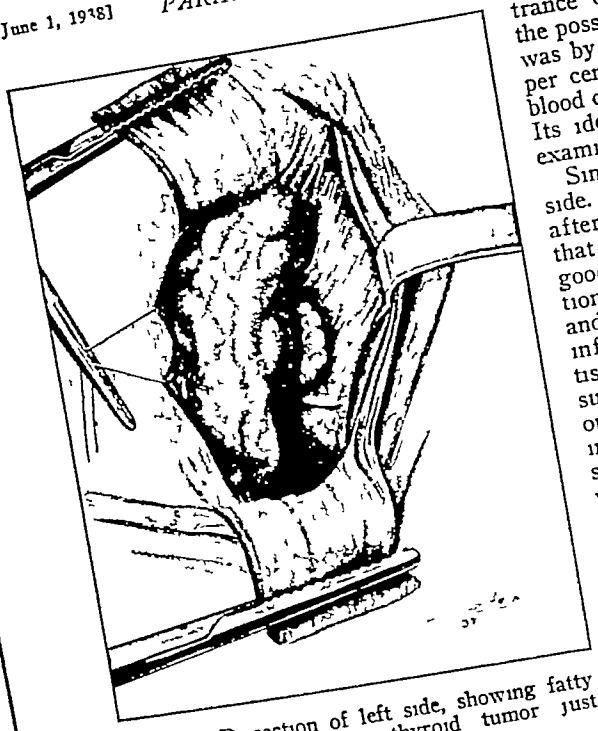


Fig 1 Dissection of left side, showing fatty capsule surrounding parathyroid tumor just above level of inferior thyroid artery

ever, was negative as far as any sign of rarefaction was concerned

In spite of the negative x-ray findings, our suspicion of a hyperparathyroidism was strengthened by the high calcium findings, and we suggested to the patient an exploratory operation on the neck to look for a parathyroid adenoma We told him that we thought there was about one chance in four of finding such a tumor, but if found and removed, he would probably be cured of his condition

Operation was accordingly done on January 21, 1937

Operation

Under cyclopropane anesthesia, the usual goiter incision was made, the muscles and fascia divided in a vertical direction in the midline, and the ribbon muscles on each side divided transversely The right side was first investigated The right lobe of the thyroid, which was of normal size and consistency was delivered and carefully examined on all sides, including superior pole, anterior and posterior surfaces, inferior pole, anterior and recurrent trachea and esophagus, and palpation with a finger down into the mediastinum The lobe itself was palpated for a possible intrathyroid tumor A rather large but normal parathyroid was found near the entrance of the inferior thyroid artery As the possibility of finding a parathyroid tumor was by this time diminished by at least fifty per cent and with the idea of reducing the blood calcium, this parathyroid was removed Its identity was immediately established by examination of a frozen section

Similar dissection was done on the left side. After a fairly thorough search and after we were warned by the anesthetist that the patient's condition was not very good, we were about to terminate the operation, when deep down between the trachea and esophagus, just above the level of the inferior thyroid artery, a mass of fatty tissue a little more circumscribed than the surrounding areolar and fatty tissue aroused our suspicion (Fig 1) This was carefully incised, and a tumor about the size of a small olive, came into view (Fig 2) It was surrounded by the capsule of fat very much as the kidney is surrounded by its fatty capsule. It had a fine stalk containing tiny blood-vessels, but otherwise was easily shelled out. The stalk was tied and divided The thyroid lobes were replaced into their normal positions and the usual closure made Examination of the specimen proved it to be a parathyroid adenoma

The patient made an uneventful recovery from the operation Fearing tetany after

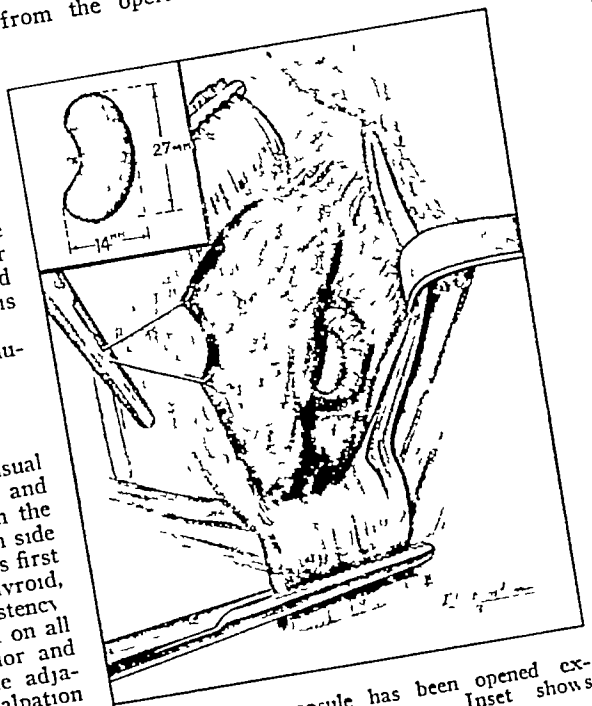

Fig 2. Fatty capsule has been opened exposing parathyroid adenoma Inset shows tumor after removal

Discussion

DR. LOUIS TULIPAN, *New York City*—In conjunction with cases of alcoholic pseudopellagra that Dr Maloney mentioned, we also followed up those cases which seem to be exaggerated by sunlight, such as lupus erythematosus, xeroderma pigmentosum, etc It was rarely that we were able to demonstrate the presence of porphyrin In experimental work, it has been proved that animals injected with hematoporhpyrin die when exposed to sunlight but remain alive if kept in dark rooms They develop edema and necrosis of skin and loss of hair That explains the possibility, as Dr Peachey mentioned, of an endocrine sympathetic disturbance

The reason, however, why porphyrin is not found more frequently may be due to the fact that porphyrinogen, which is colorless (according to Fisher) may become converted into porphyrin in the skin tissue. The amount of porphyrin in urine does not go hand in hand with clinical manifestations, as it is possible that the symptoms depend more on the amount present in the skin tissue

PARATHYROID ADENOMA AND RECURRENT RENAL CALCULI

Report of a Case

ALFRED H NOEHREN, M D and KENNETH ECKHERT, M D, *Buffalo*

From the Surgical Service of the Deaconess Hospital

As it is only twelve years since the first parathyroid adenoma was removed for the cure of hyperparathyroidism[1] and as reports of cases since have been few in number, we wish to add this case of proved hyperparathyroidism with parathyroid tumor and renal complications

Case Report

P U, Hebrew, male, thirty-eight years old, born in Poland, entered the hospital November 17, 1936

In 1926 a stone was removed from his bladder After that he was free from symptoms until 1934, when several stones were removed from his left kidney by nephrotomy and from his right ureter by the cystoscopic route In June 1936, he first entered the Deaconess Hospital with lumbar pains and blood in his urine X-ray and cystoscopy revealed a stone in his right kidney and numerous stones in the left kidney and along the course of the left ureter In July, Dr James B Cross removed the stone from the right kidney by nephrotomy The patient made a good recovery, but x-ray examination on August 25 showed that two new stones had formed in the right kidney However, the patient was feeling so well that he left the hospital on September 12 A short time after he passed two stones, considerable gravel and blood per urethra At his present admission, November 17, he complained of pain in his left lumbar region and difficulty in urination.

Examination at this time revealed a well-developed male in acute pain He was tender to hammer percussion over both loins and very tender to deep palpation over the left inguinal region He ran a low septic temperature up to 102 4°F and there was considerable pus in the urine. X-ray examination showed two stones in right kidney, a cluster of stones in left kidney, and a chain in the left ureter

On December 14 and again on December 23, several stones were crushed in the bladder and passed per urethra A few stones in the prostatic urethra could be seen, but could not be dislodged. All this time, the patient was on a ketogenic diet and the urine was kept acid. Laboratory findings during this period were as follows

Urine 1 010 specific gravity, two plus albumin, one plus blood, three plus pus cells, one plus phosphate crystals.

Nonprotein Nitrogen varied from 40 1 to 87 6

Blood 4,000 000 R B C, seventy-seven per cent Hg, 20,100 W B C., eighty-seven poly one mono, twelve lymph, ten per cent left shift.

At about this time (December), hyperparathyroidism as a possible cause for the recurrent kidney stones was first considered and a series of blood calcium and phosphorus studies made, the results of which were as follows

December 31, calcium 16 5 milligrams, phosphorus 3 8 mgms , January 21, 1937, calcium 13 5 mgms

X-ray examination of his skeleton, how-

INFECTIONS OF THE SKIN DUE TO MONILIA ALBICANS

II Immunologic, Etiologic, and Therapeutic Considerations

GEORGE M LEWIS, M D and MARY E HOPPER, M S, *New York City*
From the Skin and Cancer Unit, New York Post-Graduate Medical School and Hospital, Columbia University

The diverse manifestations of infections caused by yeast-like organisms have become fairly well-known only during the past twenty years One of the earliest reports in the United States of a case of generalized cutaneous thrush was that of Schamberg[1] in 1915 Engman,[2] in 1920, described a case of moniliasis localized to the upper part of the thighs, vulva, and submammary regions Summaries of the various clinical manifestations of the thrush organism may be found in the papers of Shelmire,[3] Beeson and Church,[4] and Hopkins[5] It is largely through the work of Hopkins[5 6] and Benham[6 7] that the former conception of a plurality of species pathogenic to man has given way to the assumption that the usual cause of so-called yeast infections is one organism, Monilia albicans Many of the fungi described and named as the cause of such infections are probably variants of this same organism Other yeast-like fungi found in skin scrapings are saprophytes for the most part and are frequently present on normal skin, for this reason, they may be considered of pathogenic significance only after due proof

Clinical Expression of Monilia Albicans

The manifestations of Monilia albicans have been well described in detail by others[3-5] We shall only consider this clinical phase in skeletal form The following outline includes the more important forms of moniliasis

I LOCALIZED

1 Onychia and paronychia
2 Erosio interdigitalis blastomycetica
3 Intertrigo (axillary, submammary, inguinal, interdigital)
4 Perleche
5 Intraoral thrush
6 Superficial glossitis (beefy tongue)
7 Stomatitis
8 Localized patches of eczema
9 Water-bed dermatitis
10 Dysidrosis
11 Vaginitis
12 Gastrointestinal (asymptomatic)

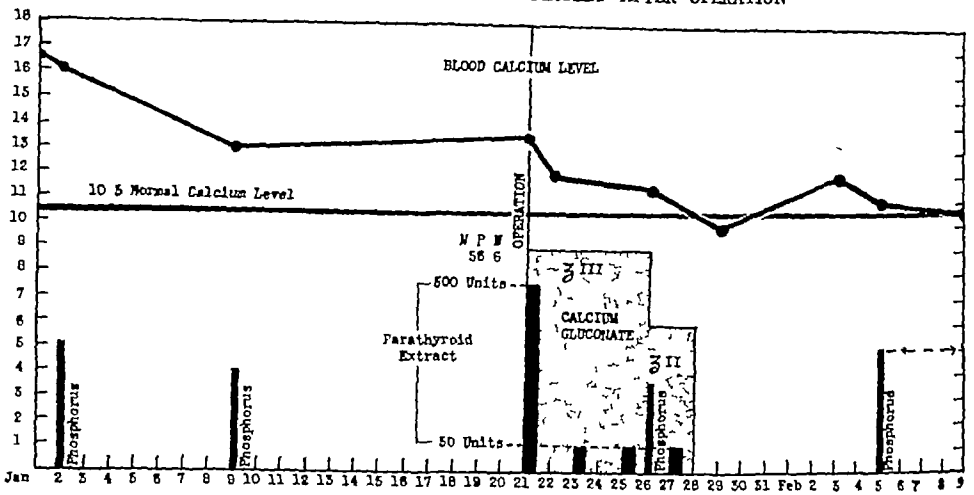
II GENERALIZED

1 Widespread eruptions usually associated with some of the localized forms Characteristic flat pustules may usually be observed in some part of the eruption These pustules become dry and macerated scales form on the surface With exfoliation, a bright red, moist surface is left with overhanging edges Sparse growth of hair may be an additional finding

2 Monilids or levurides[8] in which no fungi can be cultured and which are secondary to a focus of infection due to Monilia albicans

III SYSTEMIC

While not well defined, this group would include cases of pulmonary involvement and instances of massive infection of the gastrointestinal tract associated with an infection of the skin



It should be noted that perléche and erosio interdigitalis blastomycetica are essentially merely varieties of intertrigo and eventually may lose their specific designations

Characteristics of Monilia albicans

The recognition of Monilia albicans is usually not difficult Our routine procedure is to use both dextrose and corn meal agars to differentiate this fungus from other yeast-like fungi in culture The first mentioned medium is used to isolate the primary growth while the corn meal agar is useful to bring out its characteristics A brief summary of the essential features of Monilia albicans follows

Read at the Annual Meeting of the Medical Society of the State of New York, Rochester, May 25, 1937

CHART I—BLOOD CHEMISTRY BEFORE AND AFTER OPERATION AND TREATMENT WITH PARATHYROID EXTRACT AND CALCIUM IMMEDIATELY AFTER OPERATION

removing both the tumor and a normal parathyroid, rather large doses of parathyroid extract and calcium were given for a few days, but no signs of tetany developed

While there was not the marked drop seen in some of the reported cases, there was an immediate lowering of the level of serum calcium (Chart I) The last report (May 25) showed twelve mgms of calcium and 4 6 mgms of phosphorus

On March 17, Dr Cross drained a right perinephritic abscess and removed a stone from the right ureter X-ray examinations made since the operation, the last on April 16, show no new stones We are very hopeful that after the present stones are either passed or removed, our patient will be completely cured

Conclusions

1 Our experience with the above case and our perusal of the literature would lead us to conclude that in any case of recurring renal calculi, the possibility of hyperparathyroidism as the cause should be considered

2 If it is accompanied by a high blood calcium level and no other cause for the recurrence of the calculi can be found, an exploratory operation on the neck and search for a parathyroid adenoma are indicated

3 LINWOOD AVE.

"ONE LIGHT MUST BURN"

The entire world views with horror the arrests and suicides of noted Jewish and anti-Nazi Christian physicians in Austria The events of the past weeks strike at a humanitarian tradition that even barbarian nations have respected for thousands of years, declares the *Medical Week*

Heretofore medicine has been exempt from the consequences of political upheaval Alien conquerors and victorious politicians have recognized that the physician's mission has no concern with race or party

Disease and deformity know no racial distinctions, neither does the doctor The white physician heals the colored races, the Christian treats the Moslem, the Jew tends even the anti-Semite. More than any other human phenomenon, sickness is international and the care of the sick has always been respected as above political or religious creed

Germany and Austria have long been noted medical centers, thanks to a long succession of eminent physicians of both Christian and Jewish faith The destruction of brilliant medical careers on grounds of race or politics is a crime against the whole world If the Nazi regime has even a shred of "decent regard for the opinion of mankind" left, it will permit the medical profession, regardless of religion or political beliefs, to keep its small candle of learning and mercy alight in a world that is steadily growing darker with hatred and brutality

little diagnostic value It was suggested that the high incidence of reaction to the extract in the absence of any history of cutaneous moniliasis might be due to a previous exposure to the organism resulting in an infection without any clinical manifestations, or that Monilia albicans in the gastrointestinal tract was capable of sensitizing the skin in a manner comparable to skin sensitization to fungi imperfecti present in a focus on the interdigital webs of the feet

Further Investigation

In an attempt to find the cause for the frequent positive reactions to oidiomycin in the absence of a discernible infection of the skin due to Monilia albicans and to study further the problem of immune reactions to this organism, we recently inoculated on dextrose agar, material from the skin, tongue, and feces of one hundred patients Intracutaneous testing with oidiomycin (a commercial extract of Monilia albicans) in a dilution of 1 150 was carried out with each patient and the test sites were observed after forty-eight hours and again at the end of one week The test was considered to be positive when a reaction consisting of erythema with or without edema exceeded the size of the wheal (0 5 cm) produced by the injection of the test solution The patients were referred to us for the investigation of a suspected fungous infection The most common complaint for which these patients presented themselves in the dispensary was some type of eczema of the hands (forty-eight instances) In twelve cases, there was a well-marked interdigital dermatophytosis of the feet There were twenty-six cases of paronychia, perleche, intertrigo and other obvious examples of moniliasis There were two cases of tinea corporis The remainder of the patients had nonmycotic eruptions (psoriasis, pityriasis rosea, etc) The age of the patients varied from ten to sixty-nine years There were eighteen males and eighty-two females

Results

The results of our cultural findings from the tongue and the feces in relation to the findings from the skin and of the

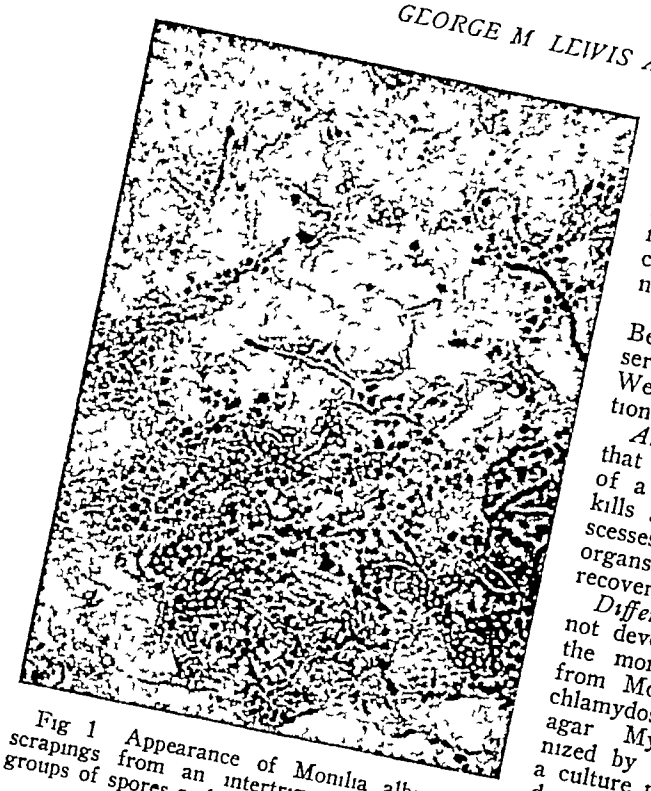

Fig 1 Appearance of Monilia albicans in scrapings from an intertrigo of feet Note groups of spores and some fine mycelium

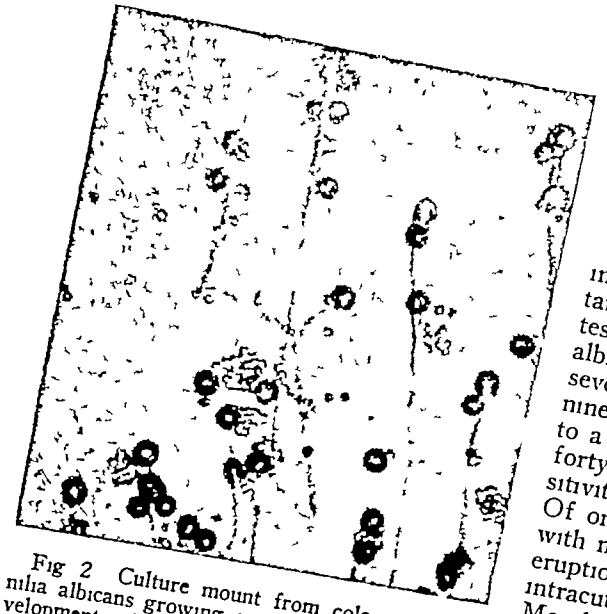

Fig 2 Culture mount from colony of Monilia albicans growing on corn meal agar Development of mycelium and spore clusters is characteristic Presence of chlamydospores helps to distinguish Monilia albicans from other fungi of monilia group

Cultures The growth is smooth, pasty, cream-colored, and grows rapidly on dextrose medium The central portion later appears honeycombed On corn meal agar, mycelium, characteristic spore clusters and chlamydospores develop Ascospores are not formed

Agglutination reaction According to Benham,[7] the organism agglutinates in a serum prepared against Monilia albicans We did not use this method for identification

Animal inoculation Benham[7] has found that the intravenous injection of one c.c of a 1 1000 suspension of a live culture, kills a rabbit in four or five days Abscesses develop in the kidneys and other organs in which Monilia albicans may be recovered

Differential diagnosis Cryptococci do not develop mycelium, and other fungi in the monilia group may be distinguished from Monilia albicans by the absence of chlamydospores when grown on corn meal agar Mycoderma may usually be recognized by its gross appearance in culture, a culture mount reveals arthrospores Endomyces and saccharomyces form ascospores, the former also grows out mycelium

A specific reaction to the injection of an extract of Monilia albicans—if of sufficiently selective nature to be capable of diagnostic use—would be of invaluable aid to the clinician and would assist in the further investigation of moniliasis Biberstein and Epstein[9] and Staehelin, Jui-Wu-Mu and van Schouwen[10] were unable to establish that such a vaccine was of any diagnostic value

Summary of a Previous Report

In another paper,[11] it was stated that in forty-two patients with localized cutaneous moniliasis, the intracutaneous test with a commercial extract of Monilia albicans elicited a response in only fifty-seven per cent of the patients Of ninety-one patients with an infection due to a fungus other than Monilia albicans forty-five per cent exhibited hypersensitivity to the extract of Monilia albicans Of one hundred and ninety-two patients with no evidence of any type of fungous eruption forty-six per cent reacted to the intracutaneous test with the extract of Monilia albicans Because of the large number of reactions to the vaccine in patients with no evidence of any skin manifestation due to the organism, it was concluded that the intracutaneous test with extract of Monilia albicans was of very

second test with oidiomycin showed a negative reaction Previously, in two of the four cases, the reaction* was ±, in one, the reaction was +, in the fourth case, it was ++ In none of these four cases had oidiomycin been administered as a therapeutic measure during the interval between the tests

Comments

From a consideration of this study, the results are seen to supplement and agree with our former work and lead us to conclude that the intracutaneous test with oidiomycin is of no practical value in the diagnosis of infections caused by Monilia albicans We do not state that the test is not a specific one The constancy of the reactions in Table V would appear to favor the opinion that such reactions are specific Sensitization of the skin to Monilia albicans occurs frequently, increasingly so with age Some of the failures to demonstrate Monilia albicans in patients who showed positive reactions to oidiomycin may be due to an inadequate cultural technic The number of patients with negative cultures would probably be reduced provided numerous specimens were obtained from each patient In some instances, we were able to culture Monilia albicans only after several prior attempts had been unsuccessful

Etiology

The source of the infection and the manner in which Monilia albicans enters the skin have not been satisfactorily explained Since Monilia albicans is a common inhabitant of the mouth and intestines,[12 13] it has been suggested that autoinoculation of the fungus from this site may occur Relapse of skin lesions may take place when a systemic or debilitating illness is experienced The resistance of the patient to Monilia albicans is decreased by diabetes, probably because the storing of sugar favors the growth of the organism We have noted that a large percentage of the patients with different types of cutaneous moniliasis are obese The organism is more apt to find suitable soil in individuals whose skin is macerated by frequent or prolonged immersion in water Housewives, bartenders, waiters and bakers appear to be more prone to the affection because of their occupation The organism is probably of weak pathogenicity but once the diseased state is established, through a letdown in the natural immune forces, the condition is apt to persist indefinitely The organism multiplies rapidly and may be isolated from such diseased tissue as carcinoma or it may be found in the sputum of a patient approaching death In such instances, one must be careful to differentiate between its saprophytic and pathogenic significance We are in agreement with Benham and Hopkins[12] that Monilia albicans is not found on normal skin The skin tests to oidiomycin are of no help in denoting those patients

* In our interpretation of the quantitative reaction of the skin to the fungous extracts, we designate ϕ, a negative reaction, ±, an area of slight erythema approximately 0 5 cm. in diameter, +, an area of reaction from 0 5 to 1 cm in diameter, ++, an area of reaction from 1 to 1.5 cm in diameter, +++, an area of reaction of from 1 5 to 2 cm in diameter and ++++, an elevated area of reaction of 2 cm or more

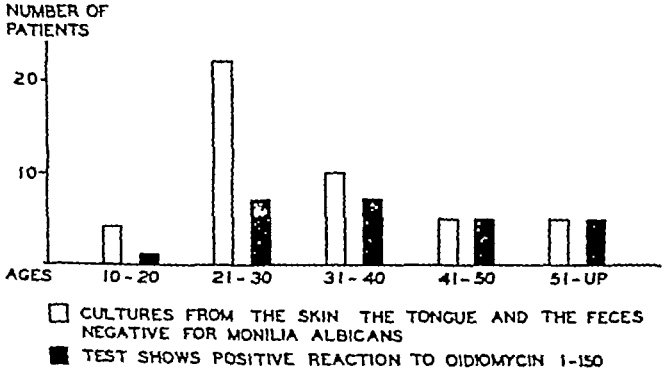

CHART II — COMPARISON OF NUMBER OF POSITIVE REACTIONS TO OIDIOMYCIN TO NUMBER OF FAILURES TO CULTURE MONILIA ALBICANS FROM SKIN TONGUE, AND FECES OF EACH PATIENT

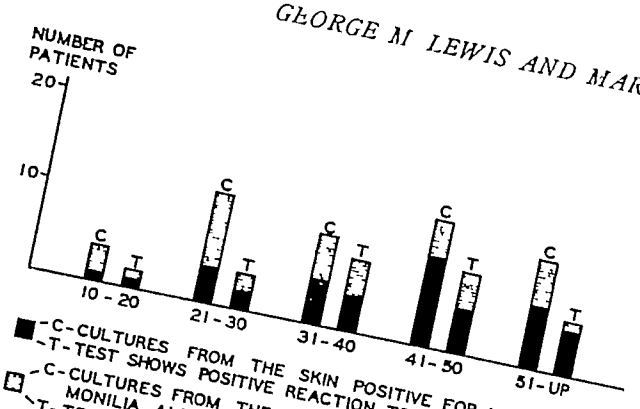

CHART I — COMPARISON OF RESULTS OF TESTING WITH OIDIOMYCIN TO THE NUMBER OF PATIENTS FROM WHOM POSITIVE CULTURES OF MONILIA ALBICANS WERE OBTAINED

intracutaneous testing with oidiomycin is given in Table I For convenience, the patients were divided into five age groups beginning with the ages of ten to twenty years The next three groups divided equally the ages from twenty-one to fifty years All patients of fifty-one years or over were placed in the last group We were able to culture Monilia albicans from lesions on the skin in twenty-seven patients, from the tongue in thirty-nine, and from the feces in twenty-seven Positive reactions to the intracutaneous test with oidiomycin were obtained in fifty-six The total number of patients who had positive cultural findings in one or more of the areas from which material was inoculated on culture media, was fifty-two (Table II) In a further analysis of the results of the cultural studies, it was found (Table III) that seventy per cent of the twenty-seven patients with positive findings on the skin also exhibited positive cultures from scrapings of the tongue In sixty-three per cent of the same group, Monilia albicans was recovered from the feces The same number (63%) revealed a positive reaction to the intracutaneous test with oidiomycin Of seventy-three patients in whom Monilia albicans was not cultured from the skin, twenty-seven per cent yielded positive cultures from the tongue and in fourteen per cent, cultures were grown from the feces In this group of patients, the oidiomycin test was positive in fifty-three per cent When the test with oidiomycin was considered in relation to the demonstration of Monilia albicans in any or all the areas—skin, tongue and intestinal tract—it was seen (Table IV) that the percentage incidence of the reactions was not far apart The test was positive in fifty-eight per cent of the patients in whom the organism could be demonstrated in at least one of the sites from which scrapings were obtained, in patients from whom the organism was not cultured, there was fifty-four per cent of positive reactions to the test From a consideration of Chart I, it is apparent that sensitization to Monilia albicans is not an invariable rule The presence of the organism in active skin lesions or in the gastrointestinal tract does not necessarily mean that there will be a positive skin reaction to oidiomycin In the graph (Chart II) of patients from whom Monilia albicans could not be cultured, it was noted that a gradual increase in the percentage of positive reactions to oidiomycin occurred with an increase in age Between the ages of ten to twenty years, twenty-five per cent of the patients with negative cultures reacted to oidiomycin, from twenty-one to thirty years, thirty-one per cent reacted, from thirty-one to forty years, seventy per cent reacted, while in the later ages, one hundred per cent reacted

In a series of twenty-nine patients (Table V), in which we were able to retest their cutaneous sensitivity to oidiomycin, there was considerable uniformity in the results of the tests The interval of time between the two tests varied from two weeks to eleven months In twelve patients, the results were the same in both tests In nine instances, there was an increase in the degree of the reaction, while in eight instances, the degree of the reaction was less in the second test In four out of the eight latter cases, the

hiasis observed by MacKee,[19] Monilia albicans was isolated from the skin, gastrointestinal tract, and sputum Treatment by means of topical applications of gentian violet together with daily inhalations of ethyl iodide according to the method of Swartz[20] resulted in marked clinical improvement. When last observed, the patient was in excellent condition.

Vaccinotherapy There are not many reports in the literature regarding the efficacy of this form of therapy Sulzberger and Wise[21] and later Kerr, Pascher, and Sulzberger[22] reported successful quantitative intracutaneous therapeutic desensitizations with trichophyton and monilia extracts and with their combination. Recently Olah[23] tried autovaccine therapy without success in cases of onychia and paronychia

In our series, forty-eight patients were treated with intracutaneous injections of oidiomycin The patients received from six to forty-four injections, the average number being eleven The vaccine was administered in doses of 1 1000, 1 500, 1 100, and 1 50, beginning with the more dilute and proceeding to the more concentrated doses The patients were given a bland application for topical use, for the most part a colored vaseline No absolute cures were noted, but there was an apparent improvement in a few of the patients In the great majority of the patients, no improvement was noted In no case was there any harmful complication such as an exacerbation of the eruption or a focal reaction The degree of reaction to a test dose of oidiomycin was not appreciably influenced by the intracutaneous injections given in this series In isolated cases, there was a slightly increased response and in a few others, the response later became less than at first These slight differences we attribute to technical difficulties in the administration and interpretation of the intracutaneous test

Summary

Cultures were obtained from the skin, tongue, and feces of one hundred patients, considered representative of the dispensary patient suspected of having some type of fungous infection We found Monilia albicans on culture in twenty-seven instances from the skin, in thirty-nine instances from the tongue, and in twenty-seven instances in the feces It was found that Monilia albicans was present in one or more of these sources in fifty-two patients Our results with intracutaneous testing with a commercial extract of Monilia albicans (oidiomycin) showed sixty-three per cent of positive reactions in patients in whom a positive culture was obtained from scrapings of the skin A positive test to oidiomycin was obtained in fifty-eight per cent of the patients who revealed a positive culture from one or more of the examined specimens A positive test to oidiomycin was obtained in fifty-four per cent of the patients from whom Monilia albicans was not cultured

From the above findings, it is concluded that the intracutaneous test with oidiomycin has no practical value in the diagnosis of infections due to Monilia albicans In a brief discussion of the etiology of infections caused by Monilia albicans, it was noted that most patients are overweight Sometimes a debilitating illness may precede the beginning of the infection All patients should also be considered potential diabetics The organism may at times become more virulent and this would explain endemics of localized moniliasis Such occupations as housewife, baker, waiter, and bartender appear to predispose to hand involvement, due to the frequent soaking of the hands and maceration

We treated forty-eight patients by means of the intracutaneous administration of oidiomycin but failed to obtain any cures There was also no consistent change in the degree of reaction at the test site to oidiomycin before and after the series of treatments We did not obtain beneficial therapeutic results in the localized type of moniliasis from a possibly inadequate trial of potassium iodide internally We stress the need for more effective treatment of moniliasis, particularly for the eradication of any nidus of infection in the intestinal tract

who are susceptible or immune to the organism It is probable that the virulence of Monilia albicans may increase and be capable of causing an infection without any apparent predisposing factor The series of cases of perlèche of children in an orphan asylum as reported by Finnerud[14] may be cited as a possible example

Treatment

It should be emphasized that a patient suffering from any form of cutaneous moniliasis may also have a focus in the gastrointestinal tract Treatment, to be comprehensive and permanently effective, should be directed at the eradication of all foci, both in the skin and in the gastrointestinal tract Unfortunately, therapy directed at the latter is not very effective The presence of an infection caused by Monilia albicans also calls for a urinalysis to detect an otherwise asymptomatic glycosuria

The treatment of infections of the skin caused by Monilia albicans depends partly on the site of the disorder and also upon the individual patient When the hands are affected, it is important to keep them from being frequently immersed in water The use of cotton and rubber gloves may obviate this to some degree *Improvement in hygiene* may be of aid in preventing the development of lesions We have not had much success with low caloric diets Most of our patients did not desire to reduce their weight

The following remedies are briefly discussed

Diet Hopkins[5] noted that a patient with generalized cutaneous moniliasis and with involvement of the gastrointestinal tract improved while on a diet free of bread, cereals, potatoes and other starchy vegetables and with the use of dextrose instead of cane sugar Magnesium carbonate and calcium carbonate were given in large doses

Local Treatmen

1 Gentian violet Churchman[13] first introduced this substance as effective in the treatment of infections caused by gram positive organisms Gomez-Vega[16] recently noted that the growth of organisms of the genera Monilia and Torula, when tested *in vitro*, were inhibited in dilutions of 1 1,000,000 of gentian and methyl violet Cornbleet[17] found gentian violet more effective when followed by an application of Gram's solution of iodine. We subscribe to the opinion of many observers that one per cent aqueous solution of gentian violet is a useful and probably the best single remedy for topical use in Monilia infections of the skin. It may also be used in the treatment of oral thrush and we are now considering giving it by mouth to attempt cure of the infection in the gastrointestinal tract

2 Other topical applications There are many other local remedies which are advocated and which are useful in certain instances Sodium perborate mouth wash and one per cent silver nitrate in nitrous ether have proven of value in certain instances Chrysarobin in strength of five to ten per cent, tincture of iodine or an ointment containing salicylic and benzoic acids are recommended by Ormsby[18] Soothing applications are sometimes necessary when acute inflammation is present

Roentgen therapy The roentgen rays are useful in the treatment of paronychia and onychia and are also sometimes effective in the treatment of perleche.

Iodides We have had limited experience in the administration of potassium iodide by mouth in the treatment of the localized forms of moniliasis In some instances we have given the medication to the point of evidence of intolerance Our results, however, have not been conclusive and we have not observed any cures In an apparently hopeless case of the systemic type of moni-

TABLE I — OPERATIVE INCIDENCE

Age	Total Length of Labor	Engagement occurred at end of	Type of delivery	Indications	Weight of Baby	
32	12 hrs.	6 hrs.	Low forceps.	Fetal distress	5–10	Prominent sacrum
28	52 hrs.	24 hrs.	Low forceps.	Fetal distress	6–2	
20	57 hrs	28 hrs.	Low forceps	Maternal exhaustion	7–3	
22	27 hrs.	6 hrs.	Low forceps.	Maternal exhaustion	6–15	
20	30 hrs.	24 hrs.	Mid A forceps.	Sudden fetal distress	6–10	Jutting promontory
36	39 hrs.	9 hrs.	Scanzoni	Persistent O P fetal distress	8–5	
36	35 hrs.	20 hrs.	Kielland	Persisten O P fetal distress	9–3	
23	64 hrs.	20 hrs.	Kielland	Persistent O P fetal distress	8–7	
20	94 hrs.	26 hrs.	Kielland	Persistent O P fetal distress	8–7	
45	30 hrs	10 hrs.	Mid A forceps.	Full dilatation 3 hours. Sudden fetal distress	7–2	

were for fetal distress after full dilatation for three or more hours

The fact that there were no stillbirths or infant deaths in this series of cases would appear to indicate that the dangers to mother and child are increased very little if any by the absence of engagement before labor in primipara with normal pelvis measurements, that conservative treatment with watchful waiting and interference only for definite indications are the methods of choice

Efforts to find the cause for nonengagement are unsuccessful None of the factors said to favor nonengagement such as hydramnios, placenta previa, eccentric adaptations of the head to the pelvis brim was observed in this series of cases It is also to be noted that nonengagement does not depend upon the large size of the baby, for the average weight of the baby in the cases delivered spontaneously was 7 lbs 4 ozs while in those delivered by operative measures was 7 lbs 6 ozs

Conclusions

1 It appears from this study that it is impossible to determine any constant or prevailing cause for the failure of the head to engage before labor in primipara with normal pelvis

2 The condition may be expected in 17 5 per cent of normal primipara at term

3 In our series one hundred per cent eventually engaged

4 Over seventy per cent will deliver spontaneously with labor moderately prolonged

5 In the remaining twenty-nine conservative treatment with watchful waiting may obviate the necessity of cesarean section and high forceps and limit the interference to a simple forceps operation

6 The stillbirth and infant death rate should not be increased

DR SUN AND DR AIR TO OPEN NEW OFFICE

Excavation work has started for New York City's new Convalescent Day Camp, said to be the first of its kind in this county, on Welfare Island, by the City-Wide Department of the WPA Division of Operations, to serve the needy of the greater city whose health may be restored more quickly by plenty of natural sunshine and fresh air in pleasant surroundings WPA will also build nine one-story stucco finished buildings a concrete promenade 2,000 feet long, a children's wading pool, and will beautify the grounds with hundreds of American elms, shrubs, and perennials

The entire park will be enclosed with privet hedging A shrubbery dogwood garden will be planted

The main building will include a recreation and dining hall, equipped to show motion pictures, to accommodate 1,000 persons Eight shelter buildings, each 100 feet long will have a sheltered terrace around three sides of each building The estimated date for completion is July 1

THE UNENGAGED HEAD IN PRIMIPAROUS LABORS IN NORMAL PELVES AT TERM

J Irving Kushner, M.A, M D, *Bronx*

From the Obstetric Service of Dr Meyer Rosensohn, the Bronx Hospital

In the supervision of the gravid patient at term with her first baby the question of engagement of the presenting part is most important In the most frequent type of presentation, the vertex, the problem becomes one of whether the head has engaged and will come through the bony pelvis Given a normal pelvis and an average-sized baby, the teaching has always been that the fetal head should be engaged in the last weeks of gestation That this is not always so, however, is seen by every practicing obstetrician and it is with some concern on the part of the attendant that labor is approached under those conditions in the primigravida Prolonged labor or an unrecognized disproportionment looms with operative delivery a probability and the outlook for the baby becomes questionable

The criterion as described by DeLee[1] and Rosensohn[2] has proved the most satisfactory as a working index of the accomplishment of engagement

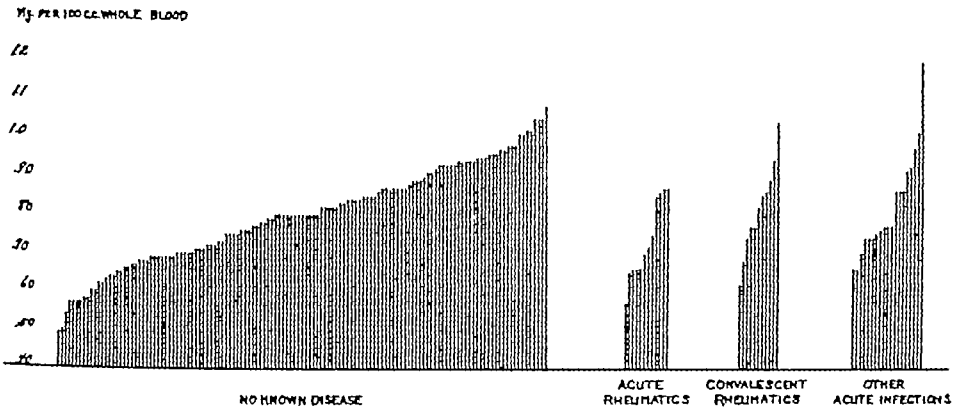
Briefly, when the curved surface of the vertex has descended sufficiently to be tangent to a line passing through the ischial spines or if the vertex can by pressure be brought to this level the largest diameters of the head are judged to be just through the brim The distances or stations of the head before or after engagement are best described as so many fingerbreadths or centimeters above or below this interspinous line It is with this definition of engagement that 200 consecutive primipara with normal pelves and vertex presentations were studied during their labor

In the 200 patients, 165 were found to have the presenting part engaged before labor began and thirty-five were still unengaged or floating with the onset of pains A study of these thirty-five cases presents certain interesting data

The incidence is one in every six primiparous labors (17 5%) Of the thirty-five cases, eighteen were floating free above the pelvic brim at the onset of labor and seventeen were dipping two or three fingerbreadths above the ischial spines, the largest diameters of the head being still well above the brim This is in agreement with the report of Harrar from the Lying-In Hospital

Twenty-five delivered spontaneously with no fetal or maternal mortality after an average of twenty-seven hours of labor In the remaining ten operative deliveries, the average duration of labor was forty-four hours In the operative deliveries there were no cesarean sections, four were low forceps, and six were median forceps with no fetal or maternal mortality (Table I) Of the median forceps, three were Kielland's and one Scanzoni for persistent occiput posterior positions, the other two

I wish to thank Dr Meyer Rosensohn, Attending Obstetrician, for his kind assistance and helpful criticism in the preparation of this paper



of thirteen cases They maintained however that digestive disturbances were responsible for the deficiencies of Vitamin C and that even in the control cases when there was a nutritional disturbance during the test the Vitamin C was not well-assimilated They concluded that the results of their study do not support the concept that a condition of ascorbic acid deficiency is a predisposing factor in the causation of rheumatic fever

Faulkner[7] likewise endeavored to study the effect of the administration of Vitamin C on rheumatic fever In twenty-seven cases of rheumatic fever the effect of the administration of large daily doses of Vitamin C was studied None of these cases showed any clinical signs suggestive of scurvy All of the patients had been on a diet generally considered to be adequate in Vitamin C All of the cases were given additional Vitamin C in the form of 530 c.c. orange juice per day No specific therapeutic effect on the course of the disease was observed during the period of increased Vitamin C administration which lasted on the average for four weeks The failure of larger doses of Vitamin C to influence the course of rheumatic fever is presented by Faulkner as evidence against the hypothesis of Rinehart that deficiency of this substance is a specific etiological factor in this disease

Perry[8] studied the relationship of Vitamin C to rheumatic heart disease In his study of eleven cases there were five active rheumatic and six quiescent cases In these cases tests were made for Vitamin C deficiency based on the excretion of ascorbic acid in the urine after the administration of a test dose of Vitamin C Perry concluded that Vitamin C deficiency is not an important factor in the causation of acute rheumatism, that mild degrees of this deficiency are not uncommon in rheumatic children, and that the capillary resistance test is not a reliable guide to this deficiency

More recently Abbasy, Hill, and Harris[9] reported on Vitamin C studies in 107 active rheumatic children, eighty-six convalescent cases and sixty-four control cases The results of their studies showed a striking difference between the excretion of Vitamin C by the rheumatic cases compared with the controls The sixty-four control subjects receiving an adequate institutional diet all excreted more than the standard level of thirteen Mg per day per ten stone of body weight The average value for this control group was twenty Mg per day In contrast, a group of 107 active rheumatic cases receiving the same institutional diets for periods of up to several months, excreted an average of only nine Mg per day This low level of excretion persisted in convalescent cases in which group eighty-six cases had an average excretion of ten Mg per day Their studies further showed that if the regular daily intake of Vitamin C was greatly increased, it took the rheumatic subjects, active and convalescent, longer to reach a given level of excretion than did the controls receiving the same large dose of orange juice Furthermore, when after five

CHART I—VITAMIN C VALUES OF WHOLE BLOOD FROM 172 CHILDREN

RHEUMATIC INFECTION

Is Vitamin C Deficiency a Factor?

ALBERT D KAISER, M D, *Rochester*

From the Department of Pediatrics of the University of Rochester School of Medicine and Dentistry

The development of accurate and rapid methods for the quantitative determination of Vitamin C has led to extensive investigations of its biochemistry and physiology Studies during the past few years have indicated that Vitamin C plays an important part in determining the resistance of the animal organism to certain types of bacterial infections and toxins For example, guinea pigs fed a ration deficient in the Vitamin are much less resistant to diphtheria toxin than are normal control animals similarly, the administration of Vitamin C (cevitamic acid) to normal guinea pigs increases their resistance to the toxin A protective effect of Vitamin C against tuberculous infection in animals has likewise been described repeatedly A correlation between the incidence of juvenile rheumatism and poverty has more than once led to the suspicion that some error of diet might be a causative factor in the disease In a recent publication Rinehart[1] cited experimental, epidemiological, and clinical data in favor of a theory that Vitamin C deficiency may be a necessary accompaniment of rheumatic fever

Inasmuch as the etiology and the factors that predispose to rheumatic fever are not clearly understood, it is of considerable importance to critically test the concept that a deficiency of Vitamin C may be a predisposing factor in rheumatic fever

Rinehart and Mettier[2] offered evidence that rheumatic fever may be due to the combined influence of Vitamin C deficiency and infection In their animal experiments they conclude that chronic scurvy with superimposed infection in guinea pigs results in a histopathological picture strikingly similar to that found in rheumatic fever in human beings Their experimental results with guinea pigs have, to some extent, been confirmed by Schultz[3] However no convincing data based upon clinical studies has been presented to substantiate this relationship of Vitamin C deficiency in rheumatic fever Van Eekelen, Emmerie, Josephy, and Wolff[4] (1933) were the first to state that Vitamin C could be detected in blood and urine They demonstrated that a single large dose of orange juice given to normal individuals resulted in an immediate marked rise in the daily urinary output of ascorbic acid, the level of which dropped almost to normal on the following days when no dose was taken Individuals previously on normal, adequate diets excreted ascorbic acid at a steady rate even after the material was omitted from the diet for several days, thus indicating that a store of the substance was present in the body From their reports and from subsequent studies there seemed to be agreement that the urinary output or response to a given dose, is a function of the body storage or degree of "saturation" which in turn is dependent upon the previous dietetic history and the demands of the organisms It is therefore probable that growing children require larger amounts in proportion to their size than do adults Johnson and Zilva[5] (1934) strengthened the idea that the daily urinary excretion of ascorbic acid is dependent not only upon the dose, but that the response to any given dose is a function of the amount stored in the body

Sendroy and Schultz[6] endeavored to test the concept of Rinehart and his collaborators, by a direct study of the Vitamin C utilization in rheumatic and in nonrheumatic patients They utilized the urinary excretion test for the determination of Vitamin C Their excretion tests in rheumatic patients relative to the controls, indicated to some degree an apparent Vitamin C deficiency in eight out

was found that the Vitamin C content was nearly as low in these acute infections as in the acute rheumatic cases It would appear therefore that the lower values found in the acute rheumatic cases are not peculiar to this disease In a number of acute rheumatic cases additional determinations of the Vitamin C content were made In all of them the Vitamin C increased as the disease improved During this period however large amounts of Vitamin C were given in the form of orange juice If one could be certain that the whole blood values of Vitamin C represent the degree of saturation it might be inferred that in the acute rheumatic infections as well as in other infections the maximum saturation point has not been reached for with recovery and additional Vitamin C intake this saturation point is elevated

Applied to the subjects with acute rheumatic fever the Vitamin C determinations of the blood, relative to the controls, indicated to some degree, an apparent ascorbic acid deficiency in eight out of twelve cases (Table I) As far as we could determine these could not be ascribed solely to poor diet However in the control groups some low values were obtained in whom no disease was noted It is impossible to state whether the cases showing evidence of a deficiency of Vitamin C are the result of the rheumatic infection or whether it existed before the infection and predisposed to the

weeks the new state of equilibrium had been attained corresponding with the new diet, the new "resting level" for the rheumatics remained markedly below that for the controls Their interpretation of these results is that with the infection which underlies rheumatic fever there is a greatly increased metabolic use of (and need for) Vitamin C and a correspondingly lowered degree of "saturation" of the body tissues

It would appear from the results of these investigators other than those of Rinehart and his coworkers and those of Abbasy, Hill, and Harris that no close relationship could be demonstrated between Vitamin C deficiency and rheumatic fever All of the studies were based on the amount of ascorbic acid excreted in the urine after a test dose was given Abt, Farmer, and Epstein[10] recently described a method for determining the reduced ascorbic acid content of the blood plasma It was stated by these workers that such a determination accurately indicates the nutritional state of the body relative to Vitamin C A study of the blood plasma values of apparently normal children, and of such children who either showed clinical evidence of scurvy or were known to have been taking an inadequate amount of Vitamin C was made It was concluded by Abt and his colleagues that blood plasma values less than 0 75 to 0 80 Mg per cent of reduced cevitamic acid indicate a subnormal Vitamin C intake Inasmuch as Rinehart and Mettier suggested that latent scurvy or hypovitaminosis C might be a factor in the causation of rheumatic fever it was decided to study the Vitamin C content of the blood plasma in a number of rheumatic individuals and compare their values with those of presumably normal children

The method used in preparing blood for Vitamin C determination is that described by Hawley and coworkers[11] Two c c of oxalated fresh, whole blood are mixed with 5 5 c c of distilled water and 2 5 c c of a mixture of eighteen percent trichloracetic acid and two percent metaphosphoric acid The whole is shaken and filtered through filter paper The clear filtrate is titrated against a known quantity of sodium dichlor-phenol-indo-phenol solution The values of Vitamin C are then computed in Mg per hundred c c of whole blood

Vitamin C determinations were made on the whole blood of 125 children ranging from six to sixteen years of age Similar determinations were also made on a number of newborn babies These children were all presumably well except for the fact that they were candidates for the removal of their tonsils and adenoids They had no recent acute infection and were free from fever It is quite certain that several of these children had an inadequate Vitamin C intake in their diet for many of them came from homes of poor parents In this group of children it was determined that the blood values ranged from 0 5 to 1 0 Mg per cent of reduced cevitamic acid with a mean of 0 75 Mg per cent Similar determinations were made on twenty-five rheumatic children The blood value ranged from 0 57 to 0 9 Mg per cent of reduced cevitamic acid The values of the acute cases were generally lower than the quiescent or convalescent cases of rheumatic infection There was however no striking difference between the values of the rheumatic children and the normal group

Most of the children as shown in Chart I with acute rheumatic infection showed lower values than was the average for the normal children of the same age Many of the children with quiescent rheumatic infection showed values as high as the average for the normal children of the same age The twelve children with acute rheumatic infection showe evidence of fever, increased leukocyt count, and an increased sedimentation rate There was practically no vomiting among any of these children The children with quiescent rheumatic infection were residents in the Cardiac Convalescent Hospital (Rochester) and were nearly all free from symptoms and had been receiving for some time a diet high in Vitamin C Comparing the children with acute rheumatic infection and the so-called control children, one might conclude that the Vitamin C values of the blood are slightly subnormal in the rheumatic group However as shown in Table II blood values were obtained in other acute febrile infections such as pneumonia, nephritis, and tonsillitis It

ALKALINE CYSTITIS WITH PHOSPHATIC CONCRETIONS

Treated With Sulfanilamide

D EDWARD FRANK, M D, *New York City*

Of recent date new uses for an old chemical have made the profession sit up and take notice As is the case with most new forms of therapy, many physicians have used it in an attempt to cure conditions not at all related to that for which the drug was originally intended As many interesting discoveries are made in this way, I decided to use sulfanilamide on a resistant case of gonorrheal prostatitis of long-standing complicated by an alkaline cystitis with phosphaturia and phosphatic concretions

Case Report

N B aged thirty-eight with a history of gonorrhea for 15 years, had been under treatment at the Department of Health, receiving prostatic massages He had taken treatment on and off for this length of time, prompted by the reappearance of his gleet, which bothered him even during his most recent treatment at the Health Department He also complained frequently of the passage of small clumps of cheesy-looking whitish material in his urine Before he passed the clumps, he would experience an uncomfortableness and urgency, relieved immediately upon the passage of the clumps Several doctors had told him they were insignificant, and that he might never get rid of them None had ever examined them under the microscope. The prostate was moderate-sized quite hard nontender and disclosed more than 100 pus cells per H P F, arranged in clumps No gonococci were present, although there were a few gram positive short bacilli and cocci Urine was alkaline, specific gravity of 1 016, albumin one plus, rest negative. Glass one of the two-glass test contained cloudy urine with shreds, glass two hazy urine with shreds Complement fixation for gonorrhea was positive, Wassermann was negative.

The usual routine therapy of weak permanganate irrigations, argyrol instillations, and prostatic massages were started Pyridium was given a short unsuccessful trial Microscopic examination of the clumps complained of revealed surprisingly, beautiful triple phosphate crystals heaped up in masses Fifty gr of ammonium chloride and 10,000 units of Vitamin A were added to the therapy in an attempt to clear the phosphaturia Therapy proved unavailing Short wave diathermy and intramuscular injections of milk did not change the picture. Cystoscopic examination three months after the first visit, revealed phosphatic concretions floating in the bladder, several areas of hyperemia without ulceration, normal ureteral orifices, no obstruction to the passage of ureteral catheters, pelvic urine clear on both sides Urethroscopic findings were those of dilated prostatic duct orifices and ejaculatory duct orifices

On June 5, 1937, more than three months after all forms of therapy had neither altered the appearance of the two-glass test appreciably, reduced the number of pus cells in the prostate or reduced the number of phosphatic concretions in the urine, I started the patient on sixty gr of sulfanilamide daily This was easily tolerated without side affects, the patient weighing 235 pounds Two days later the patient felt quite relieved for the first time The urine was still alkaline but he had stopped passing phosphates The urine was nearly clear On the fourth day after sulfanilamide the urine was clear in both glasses, and has remained so thereafter Prostatic massage revealed that the pus cells had been reduced to twenty-thirty per H P F The improvement persisted despite the fact that vitamin A and ammonium chloride were discontinued The gleet never returned and the patient was happy

infection It does seem reasonable to conclude that in the rheumatic subjects there is an increased need for Vitamin C and probably an increased destruction in the body The view has already been advanced by Faulkner that infection may increase the metabolic need for Vitamin C The question then arises does the rheumatic state differ in this respect from other infective conditions in which a lowered excretion or a lower state of saturation of Vitamin C may also be met with? Further statistical studies of the excretion of Vitamin C and the degree of saturation in the whole blood in various infectious diseases will be necessary before a final answer can be given to this question

Assuming that the rate of urinary excretion of Vitamin C is somewhat lower in acute rheumatic infection, attempts were made to determine whether the mode of utilization of ascorbic acid was different in rheumatic patients from nonrheumatics, and also whether this substance had any prophylactic or therapeutic influence in this disease (Table II) Schultz studied the therapeutic effect of ascorbic acid medication on twenty hospital patients with rheumatic fever No demonstrable beneficial influence upon the clinical picture of rheumatic fever was noted Likewise the giving of adequate quantities of ascorbic acid over periods of several weeks did not prevent the recurrence of rheumatic activity among subjects who would otherwise have been expected to develop the disease Schultz maintained that the failure of large doses adequately taken into the circulation either enternally or parenterally to alleviate the symptoms of rheumatic fever, or to prevent the appearance of new symptoms is further proof that Vitamin C deficiency is not an important factor in the etiology of this disease On the other hand Abbasy and his colleagues maintain that a striking feature is the long-continued persistence of the low Vitamin C figures even when the disease is, clinically speaking, quiescent or convalescent and the child is in an apparently good state of health They suggest that the well-known recurrences may be the result of this intrinsic low excretion in convalescent rheumatism It has been suggested as a means of diagnosis when the Vitamin C excretion is low even on an adequate diet It has been noted by Rinehart and others that taking certain drugs more rapidly depletes the Vitamin C stored in the tissues It is therefore necessary to increase the amount of Vitamin C ingested during the period of administration of such drugs as salicylates

In spite of these observations the question still remains, is the Vitamin C deficiency a cause or an effect of this infective process There is reason to believe that there may be a dietary factor at the beginning of the disease as well as a combined alteration in the metabolism of the Vitamin when the disease has developed

Conclusions

1 The experimental and the clinical evidence presented by various investigators indicates that Vitamin C plays an important part in determining the resistance of the animal organism to certain types of bacterial infections

2 There is considerable evidence that rheumatic individuals have a deficient amount of Vitamin C in the urine This is particularly true in acute rheumatic infections and less so in quiescent rheumatic infection

3 There is some evidence that the blood of rheumatic individuals has a somewhat lower level of Vitamin C This condition is also found in other febrile conditions

4 The administration of adequate amounts of Vitamin C will not prevent rheumatic infection or promptly bring about recovery There is some evidence that in a rheumatic subject there is an increased need for Vitamin C

5 Clinical studies reviewed dealing with the urinary excretion of Vitamin C and the observations made on the Vitamin C content of the whole blood do not support the contention that Vitamin C deficiency is a significant etiological factor in rheumatic infection

6 There is sufficient clinical evidence to stress the importance of regular and adequate amounts of Vitamin C administration in all individuals suffering from rheumatic disease

TUBERCULOSIS OF THE GENITOURINARY TRACT

CLARENCE G BANDLER, M D, F A C S and ARTHUR H MILBERT, M D,
New York City

Genitourinary tract tuberculosis represents an ever-present potential, if not actual, complication of pulmonary tuberculosis The urogenital lesion, in most instances, can be traced to a primary infective site in the lungs, less often to a pre-existing bone, intestinal or glandular focus With this in mind, the urologist in his diagnostic and therapeutic approach, is ever mindful of the fact that he is dealing with a local manifestation of a systemic infectious disease and the individual prognosis must be evaluated accordingly

The all-inclusive term—genitourinary tuberculosis—is particularly misleading in dealing with the female In the male, the urinary and genital systems are so interwoven in form and function as to defy any attempt to consider them as separate entities in relation to tuberculous infection Of 606 cases of genital tuberculosis reviewed at Mayo Clinic by Bumpus and Thompson[1] in 1930, renal involvement was noted in 330, or over half the entire number In the female, however, genital tuberculosis is a rarity and even when it does occur its etiology is entirely independent of the urinary tract

The combined efforts of internist, pathologist, and urologist have led to unremitting progress in the field of urogenital tuberculosis Morgagni first described a case of renal tuberculosis in 1757 and in 1872 Peters, an American surgeon, first removed a tuberculous kidney It is significant too, that most of the recent noteworthy contributions have come from American workers

Because it represents the primary urologic lesion in most instances, our attention in this brief exposition will be focused chiefly on renal tuberculosis The disease is relatively common but we shall omit ponderous statistics in favor of a few salient facts concerning its incidence

Incidence

Salleras and von der Becke[2] noted that sixteen per cent of 1,724 patients with urologic symptoms had renal tuberculosis Kronlein and Israel, in independent studies quoted by Caulk,[3] found that approximately twenty-nine per cent of all surgical operations on the kidney were for tuberculosis Caulk himself reported nephrectomy for tuberculosis in nineteen per cent of all surgical procedures on the kidney

Renal tuberculosis is especially significant in that it is most common between the ages of twenty and fifty Roughly seventy-five per cent, or 164, of 221 cases studied by Kretschmer[4] occurred in this age period Earlier age incidence has often been overlooked Mathe,[5] in a survey of 4,698 cases of unilateral surgical renal tuberculosis, in all age groups, found 565 or twelve per cent in children, but with only a 1 5 per cent incidence up to the age of ten With each advancing year, the incidence rose perceptibly, 494 cases or 10 5 per cent falling in the second decade.

Statistical studies in sex distribution show male victims slightly outnumbering females

A revealing study has been made by Caulk at the Barnes Hospital in St Louis From 1916 to 1921, the average number of tuberculosis patients admitted, in whom renal tuberculosis was subsequently disclosed and treated, was twenty cases a year, representing a ratio of 1 to 300

From 1921 to 1929, these figures dropped to sixteen cases a year, or 1 in 400—a twenty-five per cent reduction since 1916 From 1930 to 1934, the ratio had fallen to 1 to 450—a 33⅓ per cent reduction since 1916 Further, a fifty per cent decline was noted in the number of operations performed for renal tuberculosis

Such data is irrefutable evidence of the value of emphasis on the ounce of prevention rather than the pound of cure The parallelism that exists between pulmonary tuberculosis and poverty, malnutrition and physical debility, applies

Read at Tuberculosis Sanitarium Conference of Metropolitan New York February 9, 1938

Comment

The chief interest in this case lies in the fact that an alkaline cystitis with phosphatic concretion formation resistant to attempted acidification plus vitamin A therapy responded so promptly to sulfanilamide Helmholtz[1] and his coworkers have shown that the urine of patients on sulfanilamide therapy has definite bactericidal properties By adding the drug directly to urine, they were also able to demonstrate that the lethal properties resided directly in the sulfanilamide Marshall, Emerson, and Cutting[2] and others have found that the drug taken by mouth is excreted in two forms in the urine, one as the original drug, and the other as an acetylated form of the same Helmholtz and Osterberg[3] feel the acetylated form is the more bactericidal Whereas under a ketogenic diet, beta hydroxybutyric acid, or mandelic acid therapy, an acid urine is necessary for success, sulfanilamde works best in an alkaline urine Extraneous factors may tend to make the urine acid which will then contain a greater concentration of sulfanilamide than an alkaline urine, yet oddly enough will be less bactericidal than the latter Fortunately most urinary infections tend to have an alkaline urine accompanying

Being composed of ammonium magnesium phosphates, triple phosphates are more easily formed in the presence of a Proteus ammoniae infection, ammonia forming organisms, which Helmholtz[4] suggests my patient may have had The latter organisms are quite susceptible to the bactericidal action of sulfanilamide Clearing up a cystitis due to the Proteus ammoniae would at once remove the cause for triple phosphate formation It may seem a bit speculative, but since sulfanilamide seems to be such a good urinary antiseptic against the usual bacillary and some of the coccal infections of the urinary tract,[5] I wonder if the drug may not prove effective in preventing certain types of kidney stone recurrence, aided in many cases by the presence of infection

THE MERCILESS M D 'S

"You doctors of medicine cut down our infant mortality, extend our life expectancy, and ameliorate our ills—for what? So we can stand up a little longer in a rather unseemly struggle for existence. You feel it in your bones evidently, to make us utterly satiated with life before we are allowed to turn in our chips If we manage to stand the gaff physically, but fold up mentally, you are relentless, you put your psychiatrists upon us Out of the sweet calm of mental abdication they snap us back into the realm of hard sense and stern responsibility What untold liberties you take with us in the sacred name of Aesculapius!"—*Harold O Voorhis, Sec of N Y University, to the Alumni of the University's College of Medicine*

"Smog sickness" is now on the rampage in Indianapolis—respiratory trouble due to smoke and fog Respiratory diseases there have "reached an unprecedented figure," says the state medical journal, and are laid to the "smog" A rise in diphtheria is attributed to the same source The editor urges scientific firing to eliminate smoke

---

Every year more than 2000 babies are killed in accidents of one kind or another, says the *Bulletin* of the Metropolitan Life Insurance Company—more than die, in an average year, from measles, scarlet fever, and diphtheria combined Suffocation causes forty per cent of the deaths, other major causes are burns, falls, and foreign bodies in the air passages Many could be saved if the parents were warned of these dangers by physicians and nurses

---

"If politics and morals had progressed as much in the last two decades as medical science, there would be far less consumption of gunpowder"—*Harold O Voorhis, Sec of N Y University*

4 Nodule formation
5 Fibrosis
6 Calcification

One or more of these stages may be found present in the same organ

The *renal* lesion may consist of caseocavernous destruction about a papilla or at the base of a pyramid, with marked papillitis or abscess formation as represented in pyonephrosis The kidney may take on the consistency of putty Associated with the tuberculous lesion may be concomitant calculus, tumor or polycystic disease. Deposition of lime salts in areas of caseation gives rise to calcification, producing the characteristic mottled shadows on the x-ray plates The nodular tuberculous kidney is rarely seen It represents a displacement of renal parenchyma by solid nodules of conglomerate tubercles which do not caseate The fibrotic type of renal tuberculosis, while grossly similar to the nodular type is characterized, microscopically, by the absence of tubercles

The *ureter* may be the resting place for tubercle bacilli carried down from the initial focus in the kidney Implantation of the bacilli on the mucosa results in either a diffuse ureteritis or one localized to the lower end of the tubular structure The pathological picture of ureteral tuberculosis depends on the stage of the disease One may find tubercles involving mucosa, muscularis and periureteral tissues with subsequent deformities, strictures, and resultant dilatation Caseation may result in the accumulation of necrotic detritus in the lumen of the ureter, which dilates above such a point The ureteral wall may become greatly thickened, or canalized secondary to the caseous process Contracture of the lower end of the ureter produces the characteristic golfhole ureteral orifice of advanced tuberculosis

Should autonephrectomy occur or the tuberculous focus above be removed surgically, the ureter usually involutes to become a cord-like structure with obliteration of its lumen The ureter, representing but a connecting link in the urinary tract, cannot be properly considered as an entity, but merely a part of the diffuse infection Its involvement, however, may be the cause of pain or colic-like attacks When secondarily involved by renal tuberculosis, the *bladder* shows either congestion, edema, ulceration or tubercle formation about the ureteral orifice In the more advanced case, the whole viscus may become involved in a diffuse inflammatory process with ulceration, purulent exudate, mucous membrane proliferation into polypoid masses, or infiltration of the entire bladder wall Subsequent vesical contracture results in intolerance, marked urgency and frequency The ureteral orifices may, by involvement and retraction of the lower ureteral segment, produce typical "golf-hole" type ureteral openings

Symptomatology

The symptomatology of tuberculous infections of the urinary tract is varied Systemically, one may note evidence of toxicity in subjective complaints of fever, cough, sweats, malaise, anorexia, or recurrent gastrointestinal upsets Intercurrent infections are common Objectively, pallor or loss of weight are constant findings

From an urologic standpoint, the outstanding symptoms are frequency, nocturia, pyuria, hematuria, burning on urination, urgency or enuresis Pain in the loin, constant or colicky, is a less common complaint but careful bimanual palpation may reveal a tumefaction in the renal area. Urinary symptoms are intensified by the tendency to ulceration in tuberculous infection Passage of an acid urine containing tuberculotoxins over such an inflamed surface, together with the secondary contracture of the bladder, makes the tenesmus stranguary, urgency, and frequency of the victim of urinary tract tuberculosis readily understandable

Some interesting observations have been made in respect to duration of symptoms before diagnosis In 314 cases studied by Caulk the average duration of symptoms prior to observation was two years and eight months Kretschmer[9] noted that the onset of symptoms in seventeen of forty-three juvenile cases, or 39 5 per cent, was less than six months, in ten, or 23 2 per cent, from six months to one year, in twelve, or 27 9 per cent, from one to four years, and in four, or 9 3 per cent, from six to ten years The greater susceptibility of children is readily apparent in these

equally well to urogenital tuberculous infections

Etiology

The etiologic agent in the production of urinary tract tuberculosis is the human type of tubercle bacillus The avian and bovine types, most often associated with lymph node lesions, can be excluded from further consideration Many causes have been advanced for the renal lesion, varying from hereditary predisposition, trauma, malposition, malformation, or calculus, to allergy and tuberculous diathesis

The occasional association of the former conditions is probably an incidental one An embolic phenomenon represents the most common mechanism of dissemination, irrespective of whether the renal exacerbation occurs immediately or after months or years, smoldering to a final flare-up

Introduction of the tubercle bacillus into the pulmonary system may be followed by the production of the primary complex This consists of the primary focus or Ghon's tubercle, tuberculous lymphangiitis leading from this site to the regional lymph node and possible caseous lymphadenitis of this node At any stage of the cycle, dissemination or regression of the disease can occur Extension may proceed directly along lymphatics to the thoracic duct, by rupturing into a bronchus, pleura, peritoneum, or lastly, by erosion into a blood vessel

The secondary lesion produced in the urinary or genital tract is usually bloodborne Rarely does the lymphogenous or ascending route account for the infection in the kidney Although the lungs usually represent the primary focus of the disease, the culpable point of origin for the immediate urogenital lesion may be secondary to one elsewhere A careful history and physical examination is therefore obligatory

It is now almost universally agreed that an excretory bacilluria must leave its mark on kidney tissue Medlar,[6] together with Thomas and Kinsella,[7] has shown the presence of microscopic tuberculous lesions in the renal parenchyma and also has advanced strong evidence for considering most cases of renal tuberculosis as bilateral in origin

Pathology

Pathologically, the acute miliary lesion is characterized by generalized dissemination of the infection affecting both kidneys with a toxic tuberculous nephritis The "pre-clinical" lesion or stage of invasion, with the finding of tubercle bacilli in the urine, has led to a conflict of viewpoints on the subject of actual renal involvement as held by Medlar, or an excretory bacilluria without local changes as taught by Wildbolz [8]

The chronic surgical lesion of the urinary tract concerns the urologist directly Incidental involvement of the urinary or genital tract as part of a generalized miliary infection is of interest to the pathologist rather than the clinician Once a tuberculous infection has localized itself in the urinary tract, opinion varies as to whether healing takes place or whether the process goes on slowly but progressively to eventual destruction of the organ

Microscopic tissue studies prove that healing does occur in that pathological entity which goes by many names—the cortical, medical, preclinical or closed type of lesion Such foci may be microscopic or macroscopic and frequently involute and heal In contrast, however, is the open or surgical lesion involving the pelvis with extension into the medulla or cortex It is questionable whether such a lesion ever heals Hence we can understand the apparently conflicting observations of competent men, each of whom is correct Thus Medlar showed that in seventy-six per cent of tuberculous kidneys examined by him the lesions were cortical, eleven per cent medullary, and thirteen per cent both cortical and medullary Turning from this survey of the medical or closed lesion, Wildbolz, in studying 660 tuberculous kidneys removed at operation, concluded that the initial focus was to be found at the apex of the papilla Others consider the primary site of predilection at the base of the papilla. It is this latter group with which the urologist is chiefly concerned

Chronic tuberculosis in the genitourinary tract, as elsewhere, is characterized by the following

1 Tubercle formation
2 Inflammatory reaction
3 Caseation

or obliteration The ureteral catheter may be the deciding agent as to the unilaterality of the disease process by a study of the separated renal output One should be ever mindful, however, of the possibility of reflux of infected bladder urine up the unaffected ureter The presence of tubercle bacilli in a collected ureteral specimen is insufficient evidence upon which to make a diagnosis or to proceed therapeutically

Bacteriologic studies will, with care and persistence, demonstrate the tubercle bacillus in about ninety per cent of cases The bladder urine should be studied for three successive days, examining the sediment of collective twenty-four-hour specimens Urine obtained by ureteral catheterization is even more important in making a decision as to surgical intervention

A mixed infection with cocci or colon bacilli is a frequent occurrence and may mask the underlying tuberculous infection Guinea pig inoculation, while not absolutely diagnostic due to animal immunity to certain strains, is still a reliable agent Lowenstein[11] has found cultural methods even more exacting and has used the procedure routinely A thirty-five per cent sodium hydroxide solution or forty per cent sulphuric acid is applied to the sediment to rid it of other organisms It is then washed three times and inoculated on glycerine potato or albuminous culture media

Treatment

In the treatment of urinary tract tuberculosis, the urologist is not so much concerned with advanced bilateral renal tuberculosis, with or without pulmonary involvement, as he is with the unilateral, chronic kidney lesion with or without minimal involvement of the opposite organ Some contend that this type of renal tuberculosis may heal spontaneously but the majority opinion among urologists is that the only cure for a tuberculous kidney is its removal Wildbolz found fifty-eight per cent of 316 unoperated cases dead in five years, while fifty-nine per cent of 316 operated cases were alive and well after ten years

Chronic tuberculosis of one kidney offers no problem A short period of supportive treatment may be undertaken to bolster the individual's general condition and periodic x-ray check-ups made to determine the advance or regression of the lesion This period of observation should not be prolonged unduly before a decision is made Ultraconservatism may lead to disaster

In the performance of nephrectomy on a tuberculous kidney, special care should be exercised to avoid any dissemination of the disease process The organ and its surrounding tissues should be handled with gentleness and as much of the fibrolipomatous perinephritic substance as possible removed to obviate postoperative sinus formation

The disposition of the ureter varies with different operators If it is thickened, nodular or dilated with caseous material, it should be removed entirely If relatively normal grossly, it may be left *in situ* as the great majority regress and are converted into fibrous cords However, the stump should be securely ligated and phenol applied to it Some have advised exteriorizing the ureteral stump into the skin wound but we consider this procedure unnecessary and merely an invitation to more trouble

Bilateral renal tuberculosis with only slight involvement of one side and an advanced lesion on the other, represents a problem best solved by the internist and urologist in joint consideration of the individual case It is well to remember that removal of the more obvious focus may cause an arrest in the condition and may relieve especially the progressive bladder lesion with its intolerable symptomatology In the particular age group with which we are dealing, such a decision must be weighed very carefully Dependence on one partially disabled kidney is a precarious existence

In such doubtful cases and in the bilateral advanced, rest, heliotherapy, high caloric and high vitamin diet should be adopted Remarkable remissions, and we hesitate to use the word recoveries advisedly, have occurred in patients with renal tuberculosis who have been hospitalized or confined to a sanatorium The actual pathology may remain unaltered or even progress, but symptomatic relief is obtained Bladder tuberculosis usually regresses after removal of the offending focus in the kidney Its behavior is a fair

comparative figures It is also evident that earlier diagnosis lies in constant vigilance on the part of the clinician entrusted with the care of the patient

In this connection, the clinical studies of Harris[10] among Toronto children in 1930, are enlightening A diagnosis of renal tuberculosis was made once in 392 children suffering from tuberculosis of the bones and joints in a ten-year span from 1916 to 1926 Utilizing careful examination of the urine and guinea-pig inoculation, irrespective of symptomatology, *during the next eighteen months,* renal tuberculosis was found in 13 8 per cent Such data require no comment

Diagnosis

The diagnosis of genitourinary tract tuberculosis can be arrived at only by careful study of the following

1 History A background of familial tuberculosis or a record of loss of weight, malaise, cough, hemoptysis, cervical glands or bone disease, or symptoms referable to the urinary tract may be disclosed These may include disturbed urination, painless hematuria, dull loin pain or ureteral colics On the other hand a suggestive history may be entirely absent. One should not omit direct inquiry as to antecedent pulmonary ailments Pleurisy with effusion or empyema are significant when linked with definite parenchymal pathology A history of chronic lymphadenitis, long-standing bone suppuration or joint dysfunction, laryngeal or intestinal involvement and other extrapul monary foci should be carefully noted

2 Physical examination An emaciated appearance with pallor and loss of weight may be noted in addition to pulmonary, bone, gland, joint, laryngeal or intestinal pathology Examination of the genitourinary tract may evidence tenderness in the loin or the presence of a mass A tuberculous lesion of the prostate, seminal vesicles or epididymis should always be followed by study of the urinary tract.

3 Urinalysis should concern itself with

a The finding of tubercle bacilli in direct smear and stain of urinary sediment. Sterile pyuria in an acid urine represents presumptive evidence.

b Guinea pig inoculation

c. Tuberculin as a therapeutic test, with intensification of urinary findings and symptoms

Kidney function tests, utilizing phenolsulphonphthalein or indigo carmine may show normal excretion time, unilateral impairment or complete loss of function A final possibility is bilateral impairment of function

Urologic roentgenology should be preceded by an examination of the lungs, or of any suspicious bone, joint, or intestinal lesion Frequently, however, while a Ghon's tubercle or peribronchial thickening may be present, no evidence of an active renal lesion is noted

The preliminary (flat) plate of the abdomen may show a large renal shadow or irregular calcific deposits in the renal area Intravenous urography should always be done and may reveal such characteristically moth-eaten calyceal deformities or pyonephrosis with islands of contrast medium separated from the pelvic shadow or complete excavation of the renal substance The ureter and bladder may also show evidences of an ulcerative or fibrotic process

Retrograde pyelography should be undertaken only when the diagnosis is in doubt or to affirm a wavering decision as to the propriety of operative interference Caution in such instrumentation is necessary since the production of a generalized tuberculosis has been reported on several occasions subsequent to pyelography

Cystoscopic examination of the bladder may be essentially negative on inspection, or may reveal varying degrees of involvement Hyperemia, ulceration or actual tubercle formation may be visible about one or both ureteral orifices or may involve the whole bladder In this event, a notable finding is marked bladder intolerance to instrumentation and distension, which makes general, spinal or caudal anesthesia mandatory for any satisfactory examination The ureteral orifices may be normal, reddened, edematous, or retracted by ureteral involvement, producing a golf-hole type of deformity The urine ejected from each orifice may be clear, bloody or frankly purulent Indigo carmine given intravenously at this point may fairly evaluate relative kidney function

Ureteral catheterization should be undertaken in all but the very obviously diagnosed cases, taking every precaution not to introduce new infection to a previously uninfected kidney Catheterization may be found difficult or impossible in the advanced case with ureteral fibrosis

or obliteration The ureteral catheter may be the deciding agent as to the unilaterality of the disease process by a study of the separated renal output One should be ever mindful, however, of the possibility of reflux of infected bladder urine up the unaffected ureter The presence of tubercle bacilli in a collected ureteral specimen is insufficient evidence upon which to make a diagnosis or to proceed therapeutically

Bacteriologic studies will, with care and persistence, demonstrate the tubercle bacillus in about ninety per cent of cases The bladder urine should be studied for three successive days, examining the sediment of collective twenty-four-hour specimens Urine obtained by ureteral catheterization is even more important in making a decision as to surgical intervention

A mixed infection with cocci or colon bacilli is a frequent occurrence and may mask the underlying tuberculous infection Guinea pig inoculation, while not absolutely diagnostic due to animal immunity to certain strains, is still a reliable agent Lowenstein[11] has found cultural methods even more exacting and has used the procedure routinely A thirty-five per cent sodium hydroxide solution or forty per cent sulphuric acid is applied to the sediment to rid it of other organisms It is then washed three times and inoculated on glycerine potato or albuminous culture media

Treatment

In the treatment of urinary tract tuberculosis, the urologist is not so much concerned with advanced bilateral renal tuberculosis, with or without pulmonary involvement, as he is with the unilateral, chronic kidney lesion with or without minimal involvement of the opposite organ Some contend that this type of renal tuberculosis may heal spontaneously but the majority opinion among urologists is that the only cure for a tuberculous kidney is its removal Wildbolz found fifty-eight per cent of 316 unoperated cases dead in five years, while fifty-nine per cent of 316 operated cases were alive and well after ten years

Chronic tuberculosis of one kidney offers no problem A short period of supportive treatment may be undertaken to bolster the individual's general condition and periodic x-ray check-ups made to determine the advance or regression of the lesion This period of observation should not be prolonged unduly before a decision is made Ultraconservatism may lead to disaster

In the performance of nephrectomy on a tuberculous kidney, special care should be exercised to avoid any dissemination of the disease process The organ and its surrounding tissues should be handled with gentleness and as much of the fibrolipomatous perinephritic substance as possible removed to obviate postoperative sinus formation

The disposition of the ureter varies with different operators If it is thickened, nodular or dilated with caseous material it should be removed entirely If relatively normal grossly, it may be left *in situ* as the great majority regress and are converted into fibrous cords However, the stump should be securely ligated and phenol applied to it Some have advised exteriorizing the ureteral stump into the skin wound but we consider this procedure unnecessary and merely an invitation to more trouble

Bilateral renal tuberculosis with only slight involvement of one side and an advanced lesion on the other represents a problem best solved by the internist and urologist in joint consideration of the individual case It is well to remember that removal of the more obvious focus may cause an arrest in the condition and may relieve especially the progressive bladder lesion with its intolerable symptomatology In the particular age group with which we are dealing, such a decision must be weighed very carefully Dependence on one partially disabled kidney is a precarious existence

In such doubtful cases and in the bilateral advanced, rest, heliotherapy, high caloric and high vitamin diet should be adopted Remarkable remissions, and we hesitate to use the word recoveries advisedly, have occurred in patients with renal tuberculosis who have been hospitalized or confined to a sanatorium The actual pathology may remain unaltered or even progress, but symptomatic relief is obtained Bladder tuberculosis usually regresses after removal of the offending focus in the kidney Its behavior is a fair

comparative figures It is also evident that earlier diagnosis lies in constant vigilance on the part of the clinician entrusted with the care of the patient

In this connection, the clinical studies of Harris[10] among Toronto children in 1930, are enlightening A diagnosis of renal tuberculosis was made once in 392 children suffering from tuberculosis of the bones and joints in a ten-year span from 1916 to 1926 Utilizing careful examination of the urine and guinea-pig inoculation, irrespective of symptomatology, *during the next eighteen months,* renal tuberculosis was found in 13 8 per cent Such data require no comment

Diagnosis

The diagnosis of genitourinary tract tuberculosis can be arrived at only by careful study of the following

1 History A background of familial tuberculosis or a record of loss of weight, malaise, cough, hemoptysis, cervical glands or bone disease, or symptoms referable to the urinary tract may be disclosed These may include disturbed urination, painless hematuria, dull loin pain or ureteral colics On the other hand a suggestive history may be entirely absent One should not omit direct inquiry as to antecedent pulmonary ailments Pleurisy with effusion or empyema are significant when linked with definite parenchymal pathology A history of chronic lymphadenitis, long-standing bone suppuration or joint dysfunction, laryngeal or intestinal involvement and other extrapulmonary foci should be carefully noted.

2 Physical examination An emaciated appearance with pallor and loss of weight may be noted in addition to pulmonary, bone, gland, joint, laryngeal or intestinal pathology Examination of the genitourinary tract may evidence tenderness in the loin or the presence of a mass A tuberculous lesion of the prostate, seminal vesicles or epididymis should always be followed by study of the urinary tract

3 Urinalysis should concern itself with

a The finding of tubercle bacilli in direct smear and stain of urinary sediment. Sterile pyuria in an acid urine represents presumptive evidence.

b Guinea pig inoculation.

c. Tuberculin as a therapeutic test, with intensification of urinary findings and symptoms

Kidney function tests, utilizing phenolsulphonphthalein or indigo carmine may show normal excretion time, unilateral impairment or complete loss of function A final possibility is bilateral impairment of function

Urologic roentgenology should be preceded by an examination of the lungs, or of any suspicious bone, joint, or intestinal lesion Frequently, however, while a Ghon's tubercle or peribronchial thickening may be present, no evidence of an active renal lesion is noted

The preliminary (flat) plate of the abdomen may show a large renal shadow or irregular calcific deposits in the renal area Intravenous urography should always be done and may reveal such characteristically moth-eaten calyceal deformities or pyonephrosis with islands of contrast medium separated from the pelvic shadow or complete excavation of the renal substance The ureter and bladder may also show evidences of an ulcerative or fibrotic process

Retrograde pyelography should be undertaken only when the diagnosis is in doubt or to affirm a wavering decision as to the propriety of operative interference Caution in such instrumentation is necessary since the production of a generalized tuberculosis has been reported on several occasions subsequent to pyelography

Cystoscopic examination of the bladder may be essentially negative on inspection, or may reveal varying degrees of involvement Hyperemia, ulceration or actual tubercle formation may be visible about one or both ureteral orifices or may involve the whole bladder In this event, a notable finding is marked bladder intolerance to instrumentation and distension, which makes general, spinal or caudal anesthesia mandatory for any satisfactory examination The ureteral orifices may be normal, reddened, edematous, or retracted by ureteral involvement, producing a golf-hole type of deformity The urine ejected from each orifice may be clear, bloody or frankly purulent Indigo carmine given intravenously at this point may fairly evaluate relative kidney function

Ureteral catheterization should be undertaken in all but the very obviously diagnosed cases, taking every precaution not to introduce new infection to a previously uninfected kidney Catheterization may be found difficult or impossible in the advanced case with ureteral fibrosis

an epididymis, it is our feeling that simple epididymectomy should be done Castration is not indicated unless the process has extended through the tunica albuginea of the testis In repeated instances, removal of such an obvious focus has caused a regression of signs and symptoms pointing to seminal vesicle and prostatic involvement Young has advocated radical extirpation of the entire genital tract in cases of tuberculous infection, and reports clinical cures The operation is a formidable one and in his hands may be the solution to a perplexing therapeutic problem However, we must remember that removal of a local manifestation of a systemic disease cannot result in cure

The prognosis of genital tuberculosis is not a happy one The disease is progressive and statistics from different sources place the ultimate mortality between twenty-five and sixty per cent

Conclusions

This exposition essays to show that the problem of urologists is to deal with a local expression of a systemic disease With the present trend toward greater and deserved emphasis on preventive medicine, closer association between internist and urologist would undoubtedly lead to earlier recognition of genitourinary tuberculosis with far better results In many of the large centers about the country for the treatment of tuberculosis, such alliances have been made mutually advantageous and of far greater import, of inestimable value to the unfortunate victims of the disease

Accident statistics show that the most dangerous place in an automobile is the seat beside the driver Divorce Court records prove it to be a dangerous place, too —*Wichita Med Bulletin*

'If a doctor has the luck to find out a new malady, it is tied to his name like a tin kettle to a dog's tail, and he goes clattering down the highway of fame to posterity with his aeolian attachment following at his heels"—Oliver Wendell Holmes

indication of the prognosis In extreme cases ureteral transplantation and cystectomy may be the only solution

Postoperative complications are few A composite study of nephrectomy for tuberculosis in several large clinics shows an immediate mortality of 2 5 per cent Miliary tuberculosis, involving the lungs or meninges, may be set up by the operative intervention Sinus formation at the operative site can be minimized by careful technic and while its persistence may prove annoying to patient and surgeon, it usually closes without necessity for revision of the wound Astringents or sclerotic agents may be used to promote healing but in most cases even these are of doubtful value

Bladder irritability may be treated postoperatively by lavage with antiseptic solutions such as five to ten per cent argyrol or 1 5000 potassium permanganate, with 1 400 phenol for its anesthetic effect, with twenty-five per cent cajuput in oil, or gomenol, a proprietary vegetable oil Such balsamics may also be used in the nonoperative cases with similar vesical irritability Methylene blue has been used by some with excellent results

Prognosis

Concerning prognosis, we have already alluded to the immediate operative possibilities Cures have been reported in fifty to sixty per cent of operative cases from varied sources Far from being a radical step, nephrectomy may be the most conservative one Stevens[12] nephrectomized a thirteen months' old child for renal tuberculosis However, diminished constitutional resistance to tuberculosis in the young and also in the colored race, has increased the mortality rate Falci[13] noted only twenty-four per cent cures after nephrectomy in Marion's Clinic as compared to fifty-six per cent cures in adults Diffuse miliary tuberculosis or involvement of the remaining kidney with eventual insufficiency, and genital lesions, has accounted for the majority of deaths

Genital Tuberculosis

Tuberculosis of the genital tract manifests itself as a complication of almost fifty per cent of urinary tract Koch bacillus infections, in the male It may be hematogenous in origin and independent of any apparent urinary tract pathology, but in such cases investigation of the latter tract is imperative We may dismiss tuberculosis of the genital system in the female with little comment since its origin is independent of the urinary tract Involvement of the uterus, ovaries, or Fallopian tubes is usually secondary to intestinal or peritoneal tuberculosis and their presence is made known either at the time of laparotomy or on postmortem examination Involvement of the external genitals, labia, vagina or clitoris, is less often noted and in such instances is in association with similar involvement of the internal organs

The pathogenesis of genital tuberculosis has been a subject of considerable controversy One school holds that the epididymis is the primary site of the infection while another, notably Hugh Young,[14] avers that the prostate and seminal vesicles represent the primary genital site and extension to the other structures occurs later Both groups have presented facts and figures to support their claims With such a difference of opinion, the therapeutic approach is immediately placed on an unstable basis Microscopically as well as macroscopically, the tuberculous lesion simulates that seen elsewhere in the body

Diagnosis may be facilitated by eliciting a history of antecedent urinary tract tuberculosis, urinary symptoms referable to the posterior urethra, swelling of an external genital organ or general evidence of system toxicity Physical examination should include careful examination and palpation of the external genitalia and the prostate and seminal vesicles, rectally, for evidence of nodule-formation, suppuration or fistulae Congestion and ulceration of the posterior urethra or vesical neck may be noted by urethroscopy

Treatment of genital tuberculosis, other than suppuration with secondary acute infection, is never of an emergency nature Conservative medical measures and a supportive regime are always applicable Marked improvement has been noted in numerous cases of genital tuberculosis with rest in bed and actinotherapy with sun, quartz or alpine light

Where a tuberculous focus localizes in

to have an appreciable effect on the incidence or severity of reactions, as shown by a comparison of the figures for lots No 292 and 300, the latter prepared by the isoelectric purification of lot No 292 Although this procedure reduced the amount of protein in a given dose by approximately fifteen per cent, the relative incidence of reactions with the two lots is not significant

In Table II, the reactions are classified according to occurrence within twenty-four hours of the administration of antitoxin, or later With the exception of one patient who developed urticaria with fever thirty days after treatment, the interval was not over fourteen days In only one instance was an immediate reaction followed by a later delayed one

A considerable proportion of the reactions were of the accelerated or anaphylactic type, but as far as could be judged from the records, with the exception of one (possibly two), none were considered of alarming severity

The data for the entire series of 1,000 cases summarized in Table III illustrate the apparent relation of previous injection of horse-serum products and of the results of the intracutaneous test of sensitivity to the occurrence of serum reactions

TETANUS ANTITOXIN

Serum Reactions Following Prophylactic Injection

HAROLD W LYALL, PH D and PHILIP P MURDICK, B S, *Albany*
From the Division of Laboratories and Research, New York State Department of Health

In recent years there has been a general increase in the use of antitoxins and sera in the treatment and prophylaxis of various diseases, and until quite recently a great increase, particularly in New York State, in the number of persons receiving toxin-antitoxin mixture for active immunization against diphtheria. Theoretically, this should result in a larger proportion of the population's becoming sensitized to horse-serum products and a consequent increase in the incidence of serum reactions

On the basis of actual figures, the distribution by the Division of Laboratories and Research of tetanus antitoxin for prophylactic purposes has approximately doubled in the past ten years During this period, there has been a considerable increase in the potency of the antitoxin produced in this and other laboratories, and a coincident decrease in the protein content of the prophylactic dose It has been our custom to dilute the more potent material with physiological salt solution in order to maintain a constant volume of two c c for the immunizing dose—1,500 units with twenty per cent additional units to allow for possible deterioration—which is more convenient and favors accuracy in administration In view of the wider use of tetanus antitoxin, it seemed of interest to determine the incidence of serum reactions following treatment with preparations of different antitoxic potency and those repurified after concentration In addition, other factors were studied, such as the effect of previous injections of horse-serum products and sensitivity to horse serum as determined by the intracutaneous test

Through the interest and collaboration of Dr Henry Hun, Associate Surgeon at the Albany Hospital, an opportunity has been afforded during the last four years to secure information on the incidence and character of serum reactions in a group of 1,000 persons following prophylactic treatment against tetanus We are indebted to the staff of the Albany Hospital for initial information on each patient and for the complete record of a number of the cases In many instances, however, to obtain data relative to delayed reactions, it was necessary for a physician from this Division to visit the homes of the patients

Eight different lots of tetanus antitoxin were used These before dilution ranged in titer from 1,000 to 4,150 units, in protein content between seventeen and eighteen per cent. Four lots were concentrated in the usual manner by ammonium-sulfate fractionation[1] and are designated "routine." The remaining four were further purified by isoelectric precipitation[2] to remove more nonspecific protein Although the number of cases treated with individual lots is not sufficient for definite conclusions, the figures denote a trend in the incidence of reactions, and for the whole series, a favorably low average

A summary of the reactions reported with the various preparations is given in Table I Under general reactions are recorded those which caused constitutional symptoms or generalized urticaria, under local reactions, those confined to the region injected, which were generally mild and of doubtful significance In general, as the potency of the material increased and the amount of protein injected was decreased proportionally, there was a reduction in the incidence of serum reactions, This is in accord with the observations of others. Gerlough,[3] in particular, has demonstrated a mathematical relationship between the amount of serum injected and the incidence of serum reactions It is of interest in this connection that lot No 284, which was included in order to determine the effect of undiluted material of low potency, was discontinued after limited use because of an unusual number of serum reactions

Isoelectric purification did not appear

A consistently downward trend was observed in the relative frequency of general reactions in the age groups up to forty years Undoubtedly the chief factor influencing the higher percentages in the younger groups was the greater number of persons who, according to the records, had previously received injections of horse-serum products

Diphtheria toxin-antitoxin mixture apparently played an important role in sensitizing individuals to later injections of tetanus antitoxin

FOREIGN BODY IN THE UPPER ESOPHAGUS FOR FIVE MONTHS

MERVIN C MYERSON, M D, *New York City*
Department of Otolaryngology, Kings County Hospital

Foreign bodies in the air and food passages are known to cause unusual clinical signs and symptoms This is particularly so if the foreign body has been lodged in the esophagus or bronchus for a long time Despite the generally increased enlightenment on this subject, the ingestion or aspiration of a foreign body is frequently overlooked, and its presence is ascertained by accident or chance It is an accepted fact that the longer the lodgment of a foreign body the more difficult is the removal and the greater is the hazard to the individual

The following case of a jackstone in the upper esophagus illustrates the importance of considering the presence of a foreign body when symptoms, difficult of evaluation, are present

Case Report

A white girl, six years of age, was brought to the Kings County Hospital, May 20, 1936 She complained of severe pain in the region of the upper thoracic spine, posteriorly She was accompanied by her mother, who stated that since early in January, the child had suffered with pain and discomfort in the throat. She had visited several dispensaries and had seen a large number of physicians On each occasion she was advised that the tonsils should be removed The mother objected to this on the ground that the child had not had previous attacks of tonsillitis About ten days before admission she began to suffer with pains in the back, between the shoulder blades Because of a sudden increase in the intensity of the pain, and because the child developed a fever, the mother took her to the hospital

The admitting physician found a child moderately well-nourished She appeared to be in pain, her temperature was 102° F and her pulse rate was ninety-two During the examination an occasional unproductive cough was noted The nose and throat examination was apparently negative General physical examination was negative except for a deviation of the spine to the right in the lower thoracic region and for tenderness on pressure over the upper thoracic vertebrae

Fig 1 Roentgenogram taken in anteroposterior position showing jackstone in upper esophagus

The incidence of general reactions was much greater in those persons with a history of previous injection of serum or toxin-antitoxin mixture than in those with no such history The general reactions in fifteen of the forty-one patients with a positive skin test were of the immediate or accelerated type, 36 6 per cent as compared with 3 5 per cent for the whole series On the other hand, immediate or accelerated reactions developed in twenty, or 18 2 per cent, of the 111 patients with a negative skin test in whom general reactions occurred Not included in the series were thirteen patients who reacted so markedly to the skin test that the prophylactic treatment was omitted At the Albany Hospital, each patient is jections of horse-serum products, the patients were divided into two age groups and the reactions classified according to their previous history (Table V)

It appears that the tendency to reactions of persons who have previously received injections of toxin-antitoxin mixture or serum is in general the same in each group, but a much larger proportion in the younger group gave such a history Hunt[5] states that the age incidence of serum reactions seems to be constant Our figures show that in both age groups approximately seventy-eight per cent of those having a negative history in regard to the injection of horse-serum products had no reactions However, the tendency to reactions appears to have been

tested for sensitivity by the intracutaneous injection of 0 1 c c of the antitoxin without further dilution, the value of the test in differentiating degrees of sensitivity is, therefore, doubtful

An analysis of the incidence of reactions according to age groups is presented in Table IV When surveyed by the usual statistical methods,[4] there appears to be a distinct downward trend in the relative frequency of general reactions during the first forty years of life, after that there is no trend which could be regarded as statistically significant When the reactions are classified into immediate or accelerated, and delayed, the same general trend is observed

In order to determine whether the higher incidence of general reactions in younger persons was due to a larger proportion's having received previous in- definitely influenced by such previous treatment

Summary

In a group of 1,000 persons treated with prophylactic injections of different lots of New York State tetanus antitoxin, 15 2 per cent developed generalized serum reactions, 3 5 per cent within twenty-four hours Only a fourth of the reactions could be designated as severe and two as possibly alarming Localized reactions of minor significance were noted in an additional 12 5 per cent of the patients

In general, the incidence of the reactions tended to decrease with the increase in potency of the antitoxin and the coincident drop in the protein content of the prophylactic dose Repurification of the antitoxin had no appreciable effect

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B LIBER, M D, DR P H, *New York City*

Editorial Note Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

Is It Pruritus?

Itching in the genital and anal region is often misinterpreted by the patient and by the doctor alike.

I have seen cases of pruritus vulvae or ani in adults, unsuccessfully treated for years in various ways, including intramuscular protein-milk injections and psychoanalysis and the diagnosis turned out to be unromantic, prosaic pin-worms or fissures

On the other hand itching in those parts is sometimes regarded as of organic origin and inefficiently treated accordingly, although the symptom clearly arises from a peculiar psychic state. Naturally in such cases none of the usual methods will effect the least change

A woman complained of persistent and violent pruritus in and around the vulva and went for a cure, first to her family physician, who sent her to a gynecologist, then back to the general practitioner and later to a "diabetic specialist."

She dieted, douched herself, had sitting baths, used medicated suppositories and tampons local salves and general narcotic drugs, but the insupportable itch went merrily on and became worse.

Only the history of her life cleared up the true etiology

She was separated from her husband who was a wealthy manufacturer Why? Because several years before she had taken it into her head that he was going out with other women Her only proof was that the number of reserve condoms kept in a drawer and which she counted daily, had suddenly diminished! He "swore to God" that it was not true, that her arithmetic was wrong, and fell on his knees for a pardon, but nothing could heal her wounded pride.

However, she was very passionate and sorely in need of a lover, which her severe inbred ethics would not allow her So she suffered in silence and swallowed her tears But as a compensation she unknowingly developed this stubborn itching, which of course, resisted all attempts at ordinary therapy Even later, when she accepted her fate and became used to her semi-widowed situation, the pruritus did not cease She had it by habit, by the well-known inexorable law of inertia, which works so much havoc, anatomically, physiologically, psychologically

One of her several physicians seems to have understood the situation, as he once asked her, according to her story "Itching for what?" But happily she did not know what he meant.

It subsided and finally and gradually disappeared after the true cause was convincingly explained to her, which was a difficult task but which in due course of time she believed

JUST ANOTHER CASE

Poem by Weare Holbrook in This Week, quoted in J.A.M.A

Experiences clinical
Have made us slightly cynical
To us, the female form is bone and tissue
Diagnosis and dissection—
Leave us no time for affection—
So matrimony can't become an issue.
Though there may be little future
In sewing up a suture,
It's the job to which we dedicate our lives,
And we'll give each operation
Our entire concentration
And forget about our sweethearts and our wives

(Chorus)

Then it's Hip-Hip-Hip-Hippocrates!
And farewell to all that's feminine and frail—
Love affairs engender boredom
And besides we can't afford 'em
With the debts and the distractions they entail
So remember, lovely lady, though you have a pretty face,
Professionally speaking, you are just Another Case

Fig 2 Roentgenogram taken in lateral position after removal of foreign body, showing swelling and induration of retropharyngeal soft tissues due to prolonged sojourn of foreign body

Because of the localization of symptoms in the spinal region and the associated deviation, the child was sent to the orthopedic service, where x-ray study of the spine was carried out When the films were developed a jackstone was found to be lodged in the upper esophagus, just below the cricopharyngeus

Examination of the hypopharynx revealed a swelling of the retropharyngeal soft tissues There was no evidence of an abscess present

Esophagoscopy was performed without anesthesia The location of the foreign body was established, but insertion of the tube close enough for removal immediately obstructed the tracheal lumen The tracheoesophageal wall was markedly swollen, so that it was displaced forward by the esophagoscope It became necessary to insert a flexible tube into the trachea before esophagoscopy could be performed Esophagoscopy was now readily done and the foreign body removed without difficulty The child was kept in the hospital for a week until she was symptom free

A film taken of the cervical region in the lateral view after removal of the foreign body disclosed a greatly widened, prevertebral shadow in the lower pharynx and upper esophageal region

Comment

For several months this child complained of pain and discomfort in her throat During this time there was the usual throat examination, which revealed no evidence of disease

Pain and discomfort in the throat of a child should suggest the possibility of a foreign body in the hypopharynx or upper esophagus

Pain in the region of the spine is a significant symptom in the presence of a foreign body This symptom is in most instances casually considered A prolonged sojourn of an upper esophageal foreign body invariably causes such pain Therefore, this possibility should be borne in mind

In this case the swelling and displacement of the tracheoesophageal wall was sufficient to occlude the lumen of the trachea when the esophagoscope reached the involved area It therefore became necessary to maintain the patency of the trachea by means of a special tube, so that esophagoscopy and removal of the foreign body could be safely performed

136 E. 64 St

Danger of radium poisoning in the luminous paint industry in New York State has been minimized in the past few years, Elmer F Andrews, State Industrial Commissioner, declares in revealing that not one compensation insurance claim board based on exposure to radium or radioactive substances has been filed with the Department of Labor since 1934

Mr Andrews based his optimistic statement on information supplied by members of his staff after receipt of alarming reports of widespread deaths and disabilities among luminous dial painters in Illinois A quick survey of conditions in the plants operating here indicates that all reasonable safeguards are being enforced, he said

---

An amateur doctor tells us that a little whiskey and honey is good for a cold in the chest but one of our friends tells us he tried this remedy with disastrous results He was arrested for speeding and driving while intoxicated, his wife is suing him for divorce and his honey is suing him for breach of promise —*Nebr State Med Jour*

burden of responsibility and exposes himself to a thousand risks, frequently with ingratitude and downright abuse as his only reward

The veterans of martial adventures become national heroes and receive financial favors in the form of pensions, bonuses, and preferential employment rights even if they have never seen active service The physicians who turn out for fires, floods, earthquakes, and epidemics do not even receive a "thank you" from the public It is taken for granted that they should serve without reward or even gratitude in emergencies, just as it is taken for granted that they should give their time and labor without pay to public and semi-public institutions that show no regard for their professional or financial rights

There is no day of commemoration for the great discoverers of medicine, who freely give to the world discoveries which could earn them millions Instead there are grumblings and loudly-voiced dissatisfaction with the ethical code which places the public welfare above private profit and aggrandizement A thousand medical accomplishments and kindnesses are forgotten as soon as one mistake or misdeed comes to light

Organized medicine has fought and financed the fight to bring order out of chaos and integrity out of commercialism in the field of medical education Yet its activities against quackery are branded as monopolistic by a large section of the public which has benefited by its efforts There seems to be a concerted drive on the part of many advocates of state medicine to advance their cause by slinging mud at the profession

Medicine is too old to look for public gratitude It has a right, however, to demand intelligent understanding and fair play from those who profess an interest in the advancement of medical care A medical memorial day would show that the contribution of the physicians of America to the nation's welfare compares very favorably with its soldiers, statesmen's or any other professional groups

Tomorrow's Doctors

The June 1938 crop of medical graduates is somewhat smaller than for several years past This may be due to the fact that 1934 was the fifth year of the depression, or it may indicate that people are beginning to recognize that medicine offers little prospect of personal satisfaction or economic security under the threat of political control

The young men and women who are entering the profession have a hard road before them When they receive their diplomas they are buoyed up by confident thoughts of all they have learned in medical school If they are the stuff of which real doctors are made, it takes but a short time for them to discover how much they still have to learn

It has never been easy to get started in medical practice and earn a decent livelihood therein Today, with a large percentage of the population on relief and medical institutions vying with one another to provide free service for the middle class, the financial difficulties of the tyro are intensified

It is up to the established physicians in every community to extend a helping hand to those who are just starting out on the difficult road to professional success Alone and unaided, the young physician is beset by a thousand errors and temptations Frequently the friendship and advice of an older man can smooth away obstacles and allay doubts which might be the starting point for serious deviations from accepted ethical and scientific standards

It is advisable for newly licensed physicians to affiliate themselves with organized medicine at the very outset of their careers In this way they establish contact both with their contemporaries and with established practitioners who have already solved some of the difficult problems confronting the novice

Physicians like to think of their profession as a universal fraternity The word has little meaning unless those who have "arrived" are willing to stretch out a

The President-Elect

In Dr Terry M Townsend the Medical Society of the State of New York has a President-Elect who maintains the highest executive traditions of organized medicine Dr Townsend has won deserved fame both in the practice of his specialty and in the complex activities of his professional associations

Years of notable service to the Medical Society of the County of New York culminated in Dr Townsend's election to the presidency of that militant organization His experience there will stand him in good stead in the administration of the larger office which he is now to assume

For the rest, Dr Townsend is no stranger to the affairs of the Medical Society of the State of New York As head of its Public Relations Bureau he has had close and practical contact with the problems of modern medical practice The development of that Bureau into an effective weapon against vivisection, compulsory sickness insurance, and other adverse legislative proposals has to a large degree been principally of his doing

Dr Townsend is an able and experienced administrator He is thoroughly familiar with the questions which will come before him as President of the State Society Above all, he is free from sectionalism and petty prejudices and can be depended upon to take a broad view of the important problems confronting the profession today During his sabbatical year as President-Elect, he will have ample opportunity to observe the intimate workings of the State Society's official family, and learn upon whom to rely for advice and guidance, so that when he assumes his office a year hence, he will enter upon his duties further prepared to carry forward the work of organized medicine in this state

His election marks but another instance where service to organized medicine has been well appreciated He has deserved the great honor which has come to him

Soldiers of Healing

Monday was Decoration Day Many beautiful ceremonies commemorated the courage and self-sacrifice of those who have fought and fallen in the nation's wars

There is no memorial day anywhere in the country for those who wage the greatest war of all—the fight against disease In more ways than one, the physician is the nation's unknown soldier

We are not thinking solely of the great martyrs of medicine, who voluntarily immolated themselves at the altars of research We are thinking of the everyday practitioner, who carries an overpowering

scription of the attacks in arriving at a diagnosis, and considers this of far more significance than the findings obtained by the testing of auditory and vestibular function [1]

Those afflicted with this disease are disabled chiefly because of the vertigo The deafness and tinnitus, while disturbing, do not in themselves remove the patient from his sphere of activities From experience gained in a large series of cases, Crowe and Dandy state that the vertigo is always cured by the intracranial section of the vestibular branch of the eighth nerve Destruction of the end-organs in the semi-circular canals has also had a measure of success In some types of cases, a change in the patient's dietary regime to correct the water-balance metabolism in the body, as recommended by Furstenberg, has succeeded in curing Meniere's disease The condition, therefore, is no longer hopeless and here again Medicine has found the solution to one of the many problems with which it is confronted

1 Crowe S J *Medicine* Feb 1, 1938

CURRENT COMMENT

"I BELIEVE THAT SCHOOL CHILDREN should have individual preventive medical service, health examinations, and health supervision and that this service is not being encouraged in many situations, and that school children and parents are being wrongly educated because they have been led to expect that this modern form of service can and should be provided in school I believe there is need for the recognition of the fact that such service cannot be rendered on a wholesale basis Both the school authorities and the public have demanded a free service in school without taking the advice of qualified representatives of the medical profession as to the cost and time required for rendering this service on a basis of satisfactory medical standards The result is too often rapid inspections by a physician, too little observation for health disorders by teachers and nurses, and insufficient time given by the physician to cases that demand follow-up Practically every public school administrator is faced with the dilemma of limiting the number of examinations or of shortening the time spent on each child "—An interesting article by Dr Harold H Mitchell on the school health examination, to be found in the *Westchester Medical Bulletin* of May 1938

"THERE IS NO MORE REASON why medicine should be socialized than there is for the socialization of every other industry People are just as much entitled to free groceries, free clothes, free shoes, and every necessity of life as there is for free medical attendance

"Socialism will wipe out the rights of the individual and destroy the initiative and self-reliance which is the bulwark of our country

"Bureaucracy is always a curse, and centralization a lethal menace under any conditions Where the practice of medicine is concerned, it is fatal "—Editorial comment in the May issue of the *Illinois Medical Journal*

"TO ABSTAIN FROM MEDICAL ACTIVITIES under present menacing conditions is a wasteful squandering of that valuable asset of good teamwork at the very time when collaboration is absolutely vital One does not change horses in the middle of the stream When out in midocean in a storm you do not see anybody shoving off in a rowboat by himself to save passenger money Present conditions make mass action imperative and mass assaults can move mountains Few, if any, can deny need for maintenance by the medical profession of the strongest possible organization—strong in numbers, militant in spirit and untiring in its concerted efforts to protect the interests of the medical profession and in so doing the interests of the community"—Charles J Whalen

" AMERICANS CONTINUE TO SAVE, but they invest their savings in places which offer a small but certain yield—certain up to a point, but a point which, there is reason to suspect, is being passed Not everybody can find security in any direction, as workers are discovering after trusting to union agreements and seniority plans, as more workers will discover in Social 'Security' if the government's deficits continue, and as capital will discover if it clings too long to the idea that, because one security can be secure, all securities can be, after money has ceased to take risks "—Raymond Moley's remarks in *Newsweek* of May 16

brotherly hand to the young men and women who are struggling to "get there" The county medical societies, which are the core of organized medicine, should take a strong and sympathetic interest in the special problems of the newcomer in medicine

The Laxative Habit

"Did your bowels move today?" This question is the stock phrase of the intern, the pompous and all-important interrogation included in what is known as "the bedside manner," and the worried concern of the anxious parent It is the one phrase in all medicine which alone carries with it a note of threat, a feeling of superiority, and a sense of shame Really, it is terrific! With what other question can a house officer hope to cow a truculent nurse or impress her with his sense of generosity by not ordering an enema What else can so easily detract the sick patient from his aches and pains than by shaming him with a query concerning the function of his large intestine? And finally, what joy can be greater to a doting parent than to see his offspring go through the throes of a "spring tonic" or a dose of castor oil so that the heir apparent be thoroughly "cleaned out"

There are so many things in the world today which, because of their enormity might rightfully cause us concern, that at first it may seem frivolous for an earnest investigator to conduct a study on "Laxatives and Bowel Consciousness"[1] When we read the title we were amused, but when we read the text we realized that Kraemer had performed a fine piece of clinical investigation Utilizing the vast clinical material at the Presbyterian Hospital in Newark, N J, he found that seventy per cent of all patients took a laxative at least four times yearly, and *twenty-one per cent did so daily* This bowel consciousness he attributes to the medical profession and the advertisers of the innumerable laxatives on the market Habitues of the cathartics, and they can be so called in all truthfulness, are not, from a medical sense, constipated They have been indelibly impressed with the idea that at least one bowel movement daily is essential to the maintenance of a healthy body Consequently they become easy prey to the seductive copy of the commercial ads

Since laxatives never hurt anybody, why all this fuss? Merely this The average person who is chronically addicted to the use of laxatives imagines that he is a sick person, becomes a hypochondriac, and lives a very unhappy life The medical profession definitely has a problem on its hands to overcome the prevalent mild psychosis of "bowel consciousness"

Meniere's Disease

There is a great deal of confusion among physicians who are not otologists concerning the exact etiological basis for Meniere's disease Such a variety of conditions may produce the clinical picture that only after painstaking examination, concerned chiefly in eliminating these various other diseases, can a diagnosis of true Meniere's disease be made This is important because today there are at hand several methods of affording permanent relief from this disabling malady

In the main, it is essential to differentiate between those cases of vertigo, vomiting, and incoordination due to irritation of the central vestibular pathways and those which are the result of irritation of the vestibular end-organs In the former, the dizziness and staggering gait are more apt to be constant and there is less likelihood of intervals of freedom from attack In true Meniere's disease the violent attacks of vertigo appear suddenly and there is a sensation of objects whirling about Deafness is also present to a greater or lesser degree with or without tinnitus Crowe emphasizes the importance of the de-

Presidential Address

Standards of Living

CHARLES H GOODRICH, M D, *Brooklyn*

This is not a ringside chatter about a planned economy that would hamstring life and thought and initiative Nor shall we list all standards of living in practical application during this confused and hysterical period of the world's history For this would be as difficult and tedious as calling the roll at Coney Island on a hot summer Sunday afternoon In fact the very *numbers* of standards demonstrate the weaknesses of many, and their qualities vary from the divine to such base absurdities and tragedies as have turned back the clock of the old world a few centuries and in some places stopped it altogether for the time being Individually it sometimes seems as though the leading motives in the lives of some men and women prompt the doing of those affairs which shorten or cripple life, their own or others A well-known scientist, on his way down-hill, when reproached by a friend replied, "I'm going to have a good time! Life is too short to be careful." His friend retorted, "Why take such *care* to make it short"

A lady came to our office in a hurry The reason she was in haste? She had tickets for the matinee! "So you like the theatre?" "Yes," she said, "about all there is worth while in life is eating and drinking and going to the theatre!"

Alfred Austin, the English poet thinks otherwise

> "Is life worth living? Yes so long
> As there is wrong to right!
>
> * * * * *
>
> While there is one untrodden tract
> For intellect or will
> And men are free to think and act
> Life is worth living still."

This recalls the aphorism of the waggish philosopher who said "Is life worth living? That depends upon the liver!"

We once knew a great man who said "I would rather die than be compelled to stop smoking" A shocking statement for a great man!

We remember two young ladies years ago in our days of innocence. Whenever they met "Where were you last night?" "Oh! I went to Charlotte's—played cards and danced" "What did you have to eat?" There always followed a vivid description of the large dices of lobster, the variety and fillings of the sandwiches, the colors of the ice cream and candies, the consistency of the cake and the contents of the punch Many Oh's and Ah's from the other!

When we read or listen to current references to "standards of living" we infer that these are affairs that can be legislated or materials which can or must be purchased And yet the next moment we think of where we live, the home, its locations and atmosphere, its furniture and foods, its sunshine and warmth, its cooling shelter after a hectic day, its enriching affections and all of its contribution to human contentment And because such things are notably lacking for so many we set about thinking how they can be brought to more people and we are a little discontented This discontent shows that we have a bowing acquaintance with one high standard of living —concern for others We need more than a bowing acquaintance. We need intimacy For *no one* can ride to enduring glory in this world or any other in a chariot of self-gratification It is self-love, self-indulgence, and self-seeking for power and exhibitionism to a degree which obliterates true concern for others that is one of the causes and curses of our panicky civilization where the stage was almost set for a demonstration of beauty and grandeur in thought and accomplishment, broadened vision, and an unclouded horizon.

Concern for others is a lofty standard in the life of the true physician. One and all we can agree with Mazzini that "Life is a mission Every other definition of life is false. Religion, science, philosophy though still at variance upon many points all agree in this, that every existence is an aim"

Forty years ago when the old Waldorf-Astoria was new, when a million dollars sounded as impressive as $37,000,000,000

Professional Tax in Greater New York

Joseph D McGoldrick — Worth 2-4780
Comptroller
Samuel Orr
Special Deputy Comptroller

THE CITY OF NEW YORK
OFFICE OF THE COMPTROLLER
Emergency Revenue Division
50 Lafayette St., New York City

Business Tax

Medical Society of State of N Y,
2 East 103rd Street
New York, New York

Gentlemen

You are requested to advise the members of your society that Returns of Excise Tax on Gross Receipts must be filed by all professional persons engaged in a profession or vocation, for the privilege of exercising their profession or vocation for the period commencing July 1, 1937 and ending June 30, 1938, or any part thereof, where their gross receipts from the profession or vocation engaged in, exceed $10,000 00 for the calendar year 1937

Returns must be filed on or before June 15, 1938, with the Bureau of City Collections in the borough in which the practitioner maintains his office A remittance for the amount of tax due must accompany the return when filed

The tax is based upon the gross receipts for the calendar year 1937 where a person was practicing his profession during the whole of the calendar year 1937 Where a person commenced to practice after January 1, 1937, it is advised that he communicate with the Emergency Revenue Division, 50 Lafayette Street, Manhattan, (WOrth 2-4780) for further details

The tax rate is 1/10 of 1% For example, a professional person having gross receipts of $14,000 00 would be required to pay a tax of $14 00

No return is required to be filed where the gross receipts are $10,000 00 or less In no case should salaries and office expenses be deducted in determining the amount of gross receipts subject to tax

Your kind cooperation in advising your members is solicited

Yours truly,
SAMUEL ORR
Special Deputy Comptroller

May 12, 1938

(The attention of the Metropolitan members of the Society is called to this new tax—Peter Irving, M D, Secretary)

Anent "Hollywood on Crusade"

Westport, Essex County, N Y

To the Editor

It is difficult for me to conceive of anything in the way of publicity that could not do more good than the expose of the methods of quacks such as was proposed in "Hollywood on Crusade" It seems a great shame that the idea was abandoned It would seem that the A M A is to be congratulated rather than condemned for the proposed collaboration in this enterprise.

Very truly yours,
HAROLD J HARRIS, M D

April 22, 1938

BEAUTY SHOP GETS A PAT ON THE BACK

Dr H McClure Young, Editor of the *Urologic and Cutaneous Review*, remarks that we read a good deal about the horrors, but not much about the benefits to the health of regular attendance at a beauty shop It used to be said that pretty women never had skin cancer because they took immediate cognizance of any blemish The ugly duckling who regards her appearance as hopeless and does nothing about it, is very apt to be unconcerned about any added blemish in the way of a skin disorder But the ugly duckling who frequents the beauty shop in an effort to minimize her handicaps will be just as solicitous as her beautiful sister when eruptions appear That vanity which takes her weekly to the beauty shop will take her, if she is well informed, to the dermatologist. Aesculapius may be served in the beauty shop as well as Venus

rest? Do we exercise in the main the currently *unused* muscles? Do we increase the reserve air in our lungs and empty out the residual air of last week or the week before? Mentally, under the choicest light, do we delight in history, biography, literary essays, and choicest fiction sparkling with genuine humor or do we insist on a strong meat diet of medicine or its alternative, the hair raising detective yarn? We must not forget humor, the comedy, the becoming decorations of serious affairs Humor is a mental antispasmodic which relieves the sense of weight and tension of responsibility and care Some have said, "How can Doctors joke when carrying on such heavy duties?" We reply that we must pick up humor and comedy where we can and share it with those in trouble. Most of our duties are of themselves serious Life *must* have *sparkle* and *shine* The safeguard must be to avoid seeming to lack sympathy when hearts are aching or breaking Socially do we discuss great and thrilling current affairs or do we gossip about little personalities?

Recreation is what we are reaching for in these moments when we are not physically and mentally working or feeding the body and mind The majority of people occupy leisure in such ways as to curtail sleep, eat and drink too much, and mostly do or overdo affairs that harm health and reduce efficiency, with the brain and nervous system as the outstanding victims This explains the positive decline in the average degree and quality of constructive thought and work efficiency The use of modernly extended leisure means added responsibility and deserves careful study by all intelligent persons It seems reasonable to suggest that many people could profit by advice from their physicians Also that physicians might profit by absorbing this advice for themselves and their families

After cheering for the Gospel of work, supported by proper diets, and the reconstructions by leisure our next step must be to indicate that the *progress of the world*, the *physical* and *mental* ability to *work depends* upon the development and preservation of *physical and mental health* This is an outstanding consideration in enumerating standards of living For after all health forms the pedestal upon which all mortal standards of living must be erected and exalted How can we assure this essential foundation? Certainly not by awaiting the coming of minor or major mishaps in the running of the machine or disintegration of parts here and there In this department the hope of the world is prevention of injury and disease. In the realm of public health there is a steady slow growth We physicians must so arouse the public consciousness and intelligence that the desire for the delivery of preventive medical care will ultimately largely transcend and forefend the need of restorative care Much of this must be produced as a result of regular periodic examinations whether or not good health apparently prevails

As we consider life in its broadest inclusive interpretations, elemental *spiritual* standards of living are found in the Commandments of God, the dictates of a lively discerning conscience, and faith in the brotherhood of man After these we list our little human contribution This is not really ours for it finds place in the galaxy of ideals treasured by and vitalizing hosts of physicians

Our thesis is that mental and physical progress, the *living forward* of mankind, depends largely upon these standards of living, mental and physical work, mental and physical diets, mental and physical recreation, which are all dependent upon mental and physical health As our official valedictory we urge that much may be contributed to physical and mental health by increasing the vogue of preventive medicine and the periodic inventory of what health we have and what, if anything, hazards or imperils its influence and effectiveness

---

Hope for the thousands throughout the world afflicted by cancer, with dramatic demonstrations by dioramas of what science is accomplishing in fighting the scourge, is the theme of an exhibit to be made at the New York World's Fair 1939 by the New York City Cancer Committee

Contract for 500 square feet of display space in the exposition's $400,000 Medicine and Public Health Building has been signed by Dr Francis Carter Wood, Director of the Institute for Cancer Research Columbia University, and Grover A Whalen, President of the Fair Corporation

does now, the superintendent in charge of a nearby building under construction handed one of his hod-carriers his pay-envelope saying "Pat, there's your million" "My million?" said Pat "Yes!" said the boss —"but what would you do if you really had a million dollars?" "Phwhat would I do?" said Pat, "I'd go over there to the Wallydorf-Wistoria Hotel and get a fome room and leaf a call for six o'clock in the marning and when that bloody spalpeen of a bye came along and knocked at my door I would yell at him, 'Go to blazes— I don't *have* to'"

Returning to now Mr Henry Ford has often furnished us with interesting and helpful side-lights upon standards of living and some practical lessons as well A fortnight ago he visited the President and, soon after, he was interviewed by newspapermen Among the questions "Do you believe that it strengthens a man to undergo hardship?" Answer, "Of course it does"—"What about the hardship of unemployment?" "That's the worst hardship in the world" "Does *it* strengthen a man's character too" "It does if it drives him to get himself out of his unemployment"

Recently while we were passing a noisy restaurant-party discussing current events one of the participants shouted, "What's the matter with the world anyway?" We heard no more—but a few days later Mr Charles Hanson Towne provided an answer to this query in these lines

"The light o' the world has not died yet,
On many a peak and minaret
The sun still sparkles as of old,
With flaming flashes of mellow gold
* * * * *
The dew is still upon the rose
In many a dreaming garden-close,
The meadows shine, the aspens quiver
By every softly moving river
The birds still sing, the bees still hum
Though lands know pandemonium
Only man fails, and only he
Forgets what man was meant to be"

Moreover, "There is nothing of which man is so fond and withal so careless, as life," (LaBruyere) and this is our reason for briefly prattling about standards of living And as we proceed we must remember that "Life can only be understood backwards— but it must be lived forward." (Kirkegaard)

We believe in the Gospel of work, *mental work* which solves problems, discovers new truths, evolves new methods of procedure, and gains mental strength by brain exercise This thrills one's associates and followers with the assurance that life is better for everyone concerned if we think straightforwardly daily, vigorously but with restraint, confidently but gently, competently but without exultation Clean, wholesome exercise of the mind develops character, usefulness, influence, as well as more mental ability, and includes sound gaity and humor

We believe also in physical work which affords mutual service to mankind and increases the skill of mankind This makes life better for all through the simplest labor of field and home, of factory and street, in the application of heat, electricity, natural and fabricated power, in the developments of arts and sciences for increasing human comfort and satisfaction The *cultural* arts and sciences represent elaborate, often delicate mutual *adjustments* of mental and physical work

To work well physically and mentally, wholesome, digestible diets are required While physical diets may contribute somewhat to serenity and ability of mind we consider that in largest degree their calories produce the heat and energy which make muscular power and utility comprehensive and accomplished However, an excess of physical food may reduce the powers of motion and thinking

It is a very generalized standard of living that physical food should not be tainted, foul or offensive It is to be regretted that this standard is not observed equally with a lot of the mental pabulum which is for sale in our markets Much of it is so offensive that even goats might refuse it. The careful selection of physical and mental diets seems important in promoting our Gospel of work

To accomplish a desirable degree of work and to think forwardly and constructively we need to practice for ourselves and prescribe for our fellows a regular, systematic, sensible degree of recreation We will use the ancient pronunciation re-creation! There is its meaning! Mental re-creation! Physical re-creation We all know how we have planned it and *sometimes* carried out our plans We question if the prescription is always well-balanced! Is there enough sunshine, oxygen and joy in it? Is there a generous dosage of the best quality of

WORKMEN'S COMPENSATION

The Committee has received the following communication

Dr David J Kaliski, Chairman
Workmen's Compensation Board

Dear Doctor Kaliski

The question of the period of time x-ray plates should be kept as a matter of record in compensation cases was considered by the Industrial Council and the following recommendation was made to the Industrial Commissioner

All x-ray plates relating to compensation cases shall be kept on file by all physicians, hospitals, x-ray laboratories, insurance carriers and employers for a period of at least five years and that in no case shall they be destroyed without a report of the findings of such x-rays being filed as a permanent record No x-ray plates shall be destroyed which may be involved in any open and active compensation case

I am sending this recommendation to all interested parties requesting their cooperation

May I ask that you kindly arrange for the distribution of this recommendation to all authorized physicians requesting their cooperation

Yours very truly,

ELMER F ANDREWS
Industrial Commissioner

May 5, 1938

AMERICAN BOARD OF ANESTHESIOLOGY

The American Board of Anesthesiology, Inc., an affiliate of The American Board of Surgery, was organized in response to many requests to establish official recognition of physicians competent to practice and teach anesthesiology as a specialty This Board, through its affiliations with the American Board of Surgery, is a member of the Advisory Board for Medical Specialties

Committees representing The American Society of Anesthetists, Inc., and The American Board of Surgery, carefully studied the possibilities for the organization of this affiliate board As a result of these deliberations, delegates from The American Society of Anesthetists, Inc., The American Society of Regional Anesthesia, Inc, and the Section on Surgery of the American Medical Association, met and completed the plans for the affiliation with the American Board of Surgery in June 1937 In February 1938, the Advisory Board for Medical Specialties approved the affiliation and The American Board of Anesthesiology proceeded with its incorporation in the State of New York.

The cooperating societies and their representatives are

Dr Ralph M. Tovell, Dr Harry Boyd Stewart and Dr Henry S Ruth, from the Section on Surgery of the American Medical Association.

Dr Emery A Rovenstine, Dr T Drysdale Buchanan, and Dr John S Lundy, from The American Society of Anesthetists, Inc.

Dr Paul M. Wood, Dr Philip D Woodbridge, and Dr Ralph M Waters, from The American Society of Regional Anesthesia, Inc.

The following officers were elected President, Dr Thomas Drysdale Buchanan, Vice President, Dr Henry S Ruth, Secretary-treasurer, Dr Paul M Wood.

The term of membership on the Board will be six years

Two groups of candidates are recognized for qualification by the board (a) those who have already amply demonstrated their fitness as trained specialists in anesthesiology, the Founders' Group, and (b) those who, having met the general and special requirements exacted by the board, successfully pass its qualifying examination

The Founders' Group, on invitation by the board, may be chosen from (1) professors and associate professors of anesthesia in approved medical schools in the United States and Canada, (2) those who for fifteen years prior to the board's organization have limited their practice to anesthesiology, and (3) those who hold the certificate of Fellowship in The American Society of Anesthetists, Inc.

All applications for the Founders' Group must be received by January 1, 1939 No candidate will be considered after that date

Requirements for those to be qualified by examination will be

1 Graduation from a medical school of the United States or Canada recognized by the Council on Medical Education and Hospitals of the American Medical Association or graduation from an approved foreign school

2 Completion of an internship of not less than one year in a hospital approved by the same council, or its equivalent in the opinion of the board.

3 Special training A further period of graduate work of not less than three years devoted to anesthesiology taken in a recognized graduate school of medicine or in a hospital or under the sponsorship accredited by The American Board of Anesthesiology for the training of anesthetists This period of special training shall be of such character that the relation of the basic sciences to anesthesiology shall be emphasized. Adequate clinical experi-

THE WOMAN'S AUXILIARY

To the Medical Society of the State of New York

THE THIRD ANNUAL CONVENTION of The Woman's Auxiliary to the Medical Society of the State of New York was held at the Waldorf-Astoria Hotel on May 9-12 The following officers were elected

President Mrs Daniel Swan, Queens
President-Elect Mrs G Scott Towne, Saratoga
1st Vice President Mrs Edwin A Griffin, Kings
2nd Vice President Mrs Louis A. Van Kleeck, Nassau
Treasurer Mrs Carlton F Potter, Onondaga
Recording Secretary Mrs Henry L. Hirsch, Nassau
Directors for three years Mrs Herman Galster, Schenectady
Mrs Francis Irving, Onondaga

DELEGATES

Mrs Francis Irving, Onondaga
Mrs Daniel Swan, Queens
Mrs Luther Kice, Nassau
Mrs George Scott Towne, Saratoga
Mrs Edwin Griffin, Kings
Mrs Henry Hirsch, Nassau
Mrs Louis Van Kleeck, Nassau
Mrs James Elliott, Kings

ALTERNATES

Mrs William Groat, Onondaga
Mrs James Dobbins, Queens
Mrs John L Bauer, Kings
Mrs Charles Goodrich, Kings
Mrs P A. Williams, Nassau
Mrs R. D Bullard, Nassau
Mrs A M Bell, Nassau
Mrs Louis Lally, Nassau

At the Post Convention Meeting Mrs Daniel Swan, President, appointed the following to serve with her

Corresponding Secretary Mrs Abraham Braunstein, Queens
Archives Mrs Albert Greene, Schenectady
Convention Mrs John Buettner, Onondaga
Finance Mrs William Godfrey, Queens
Hygeia Mrs Horace Whitely, Onondaga
Historian Mrs William Benenson, Queens
Legislation Mrs R. F Sengstacken, Rockland
Organization Mrs Luther Kice, Nassau
Parliamentarian Mrs Walter F Smith, Jefferson
Press and Publicity Mrs Thomas d'Angelo, Queens
Printing and Supplies Mrs Otto Pfaff, Madison
Public Relations Mrs J Emerson Noll, Orange

SPECIAL COMMITTEE

World's Fair Mrs Harry Mencken, Queens

The Convention activities were in charge of Mrs Edwin Griffin, who with her able committees spared no efforts to make the convention a success

The Monday morning session and part of the afternoon session were given over to the reading of reports by the Board Members Each County Auxiliary President or her representative spoke on what her auxiliary had done, or was doing The work of each county varies according to the interest or needs of its members

On Monday afternoon the guest speaker for the Auxiliary was Mr Dwight Anderson, chairman of the Public Relations Bureau of the Medical Society of the State of New York Mr Anderson spoke on "Public Relations and the Woman's Auxiliary" He suggested that one of the functions of the Auxiliary was to act as a liaison between the public and the medical profession. The Auxiliary should be careful not to initiate anything pertaining to medicine without the consent of the profession

The Annual Dinner of the Auxiliary members, doctor's wives, and their friends, held in the Le Perroquet suite was well attended Mrs Augustus Kech, President of the National Auxiliary, was the guest of honor

The Tea in the Le Perroquet suite was a delightful affair The Auxiliary members and their friends enjoyed the few remarks of Dr Charles Gordon Heyd, who in closing spoke briefly about the Physicians' Home. They also enjoyed the talented dancing of charming Mrs Joseph Eller

Mrs Griffin introduced Mrs John L Bauer, organizer of the Auxiliary and its first President

Another attractive feature of the Convention was the Hobby Show Here the doctors and their wives exhibited all kinds of articles either made or collected by the Hobbyist From the interest shown in the show this year, there is no doubt that new hobbies and exhibits will be fostered for the show at the convention next year

* * *

MRS DANIEL SWAN is to represent the Woman's Auxiliary to the Medical Society of the State of New York at the Convention of the National Auxiliary in San Francisco this month

Public Health News

Division of Tuberculosis

J Rosslyn Earp, L R C.P, Dr P H
New York State Department of Health

The Division acted as host to a conference of District Health Officers and other members of the Department at the Hermann Biggs Memorial Hospital in Ithaca, April 18–20 The first two days of the conference were devoted exclusively to consideration of the campaign against tuberculosis The conference was opened by a really notable address by Dr Max Pinner, Chief Diagnostic Pathologist, Tuberculosis Hospitals Discussing the bacteriology of tuberculosis Dr Pinner attributes the contradictory results obtained in experiments on infection and immunity to the fact that bacteriologists have been working with the mixture of strains, some of which are highly virulent and others much less so He then turned to a defense of the old-fashioned method of finding tubercle bacilli in the sputum by staining a smear Concentration methods have received credit, he says, because smears are improperly made Not only so but the specimens sent in to be tested not infrequently contain nothing but saliva The patient does not appreciate the importance of providing a specimen from below the larynx and the doctor does not always take time to explain this to him In children and in others who swallow their sputum an examination of gastric contents may be necessary In the State Tuberculosis Hospitals a patient is not considered sputum-negative until after the sputum has been tested by inoculation into a guinea pig or by culture which is considered equally reliable.

When the available methods for testing sputum are properly and sufficiently used, every positive result means active disease. Moreover, a negative finding, statements in the textbooks to the contrary notwithstanding, has practically the same significance as a positive, a patient with a demonstrable parenchymal lesion in the lung, signs of activity, a reasonable amount of sputum, but with no tubercle bacilli in the sputum, almost certainly does not have tuberculosis Apart from such signs, and with x-ray evidence of tuberculosis a negative sputum signifies an early minimal lesion or a healed lesion

This very reliable sputum test is not sufficiently used either in case-finding or in diagnosis

Dr Pinner then turned to a discussion of the pathology of tuberculosis after the primary infection has taken place He did not attempt finally to decide the controversy as to whether reinfection comes from within or without, but presented with great cogency a number of forceful arguments in support of the theory that reinfection is usually endogenous An infected individual may be and, he thinks, very likely is, immune to ordinary exogenous reinfection but may still be subject to reinfection within as is the case in syphilis The possibility of massive infection exists only from the patient's own focus Massive infection from without is physiologically and physically impossible He admits that a higher rate of active disease is found in the group of contacts than in non-contacts but he points out that many studies of contact groups have been made in slum populations and states that a much wider variation of fatality rate (from 28 to as high as 250 per 100,000) results from variation in environment than results from the presence or absence of contact with an active case

In the presence of silicosis a rate as high as 500 per 100,000 is found and yet women living in these communities where the men suffer from silicosis and tuberculosis have mortality rates from tuberculosis no higher than those of women of the same age groups in the general population Again, at puberty and during the child-bearing age, tuberculosis is much more prevalent among women than among men Finally, Dr Pinner pointed to the effect of the war on the German tuberculosis death rate, the fall in the rate being rapid when food again became available after the war in spite of the continuance of great overcrowding due to the shortage of low-cost housing

* * *

The annual report of the Division contains a great deal of statistical evidence capable of correcting the impressions that may have been formed by an imaginative optomist. Those who have been engaged for the last ten years in the "early diagnosis campaign" have a cruel surprise in store Early diagnosis is still an ideal Ten years

ence in which the candidate has assumed the whole responsibility will be required An additional period of not less than three years of study or practice limited to anesthesiology

4 The candidate must present to the board sufficient evidence of good moral character, and that he has limited his practice to anesthesiology as a specialty and that he intends to be so engaged

The qualifying examination will be divided into two parts Part I, written, and part II, oral and practical Part I will consist of a written examination covering such topics as anatomy, biochemistry, physiology, pharmacology, physical diagnosis, therapeutics, pathology, and public health, in relation to Anesthesiology Part II, oral examination, may cover topics in the above list, and, in addition, such questions on physics and mechanics as are important in anesthesiology, especially dealing with electrical theories and the proper handling of high pressure gases and inflammable agents The practical examination will consist of actual observation of clinical work in the applicant's own operating theater when possible, and it may consist of cadaver demonstrations of regional blocks, sites for alcohol injection, and procedures for resuscitation or inhalation therapy and clinical experimentation

The fee for Group A, Founders' Group, shall be $25 The fee for Group B shall be $50, payable $25 on application, which shall be returned if the candidate is not accepted for examination, and $25 on taking the examination Re-examination within two years may be had if necessary without additional fee. Once a candidate has become qualified, he will have no further financial obligation to the board

The board will hold its first examination (Part I, written) at various points in the United States and Canada, during July 1938 Part I and Part II will be held in New York City, October 21, 1938

Requests for booklets of information, application blanks and other information should be addressed to the Secretary, Dr Paul M Wood, 745 Fifth Avenue, New York City

HEALTH OFFICERS AND PUBLIC HEALTH NURSES

Annual Conference Scheduled for June 28-30

Albany, May 15—Governor Herbert H Lehman, Dr Edward S Godfrey, Jr, state commissioner of health, and Dr William A Groat, president of the Medical Society of the State of New York are listed among the principal speakers for the opening of the annual conference of health officers and public health nurses at Saratoga Springs, June 28, 29, and 30, according to a tentative program announced today by the State Department of Health Conference headquarters will be in the Grand Union Hotel

At the joint conference during the afternoon of the first day addresses will be given by Dr Ludvig Hektoen, executive director of the National Advisory Cancer Council, Washington, D C, Dr George Baehr, New York City, and Dr Harry Kruse of the Milbank Memorial Fund, New York City

On the second morning of the conference the speakers will be Dr Lowell J Reed, dean of Johns Hopkins School of Hygiene and Public Health, Baltimore, Dr Eugene L Bishop, medical director of the Tennessee Valley Authority, Knoxville, and Bailey B Burritt, general director of the Association for Improving the Condition of the Poor, New York City

Speakers listed for the afternoon session of health officers on June 29 are Walter D Tiedeman, chief of the bureau of milk sanitation of the State Department of Health, F W Gilcreas, associate sanitary chemist of the division of laboratories and research of the Department, Andrew Allen, chief of the bureau of camp sanitation of the Department, Dr Samuel Frant, New York City Health Department, and Thomas C Stowell, assistant director of the division of public health education of the State Department of Health

At the conference of public health nurses on the second day the speakers will include Miss Marion Rickert, medical social work supervisor of the State Department of Social Welfare, Miss Marian A Davis, consultant public health nurse of the division of orthopedics of the State Department of Health, and Miss Marie E Swanson, supervisor of school nursing of the State Education Department.

The annual dinner of the Health Officers' Association and State Organization for Public Health Nursing will be conducted in the main dining room of the Grand Union Hotel at 7 30 P M on June 29

During the final session of the conference addresses will be given by Dr Paluel J. Flagg, chairman of the committee on asphyxia of the American Medical Association, New York City, Dr Louise Pearce of the Rockefeller Institute for Medical Research, New York City, and J E Long, Delaware and Hudson Railroad, Albany

serologically Treatment should be given as soon as the diagnosis of syphilis has been made and should be continued for many years The child of a syphilitic woman should be examined frequently Periodic serological, clinical and x-ray examinations should be made.

8. When stigmata indicating congenital syphilis are present, every effort should be made to confirm the diagnosis of syphilis in the child, its parents and other children Patients with signs of late congenital syphilis should also be treated

Laboratory Aids in the Diagnosis of Pernicious Anemia

Patients with pernicious anemia (Addisonian type) are apt to present themselves with one or more of the following groups of symptoms

I Weakness and pallor which may have a yellowish tinge.

II Vague gastrointestinal symptoms, sore tongue, and the red-glazed appearance due to atrophy of the lingual papillae.

III. Symptoms of nervous system involvement, particularly numbness and tingling in the extremities, and loss of vibration sense.

In the presence of such symptoms the correct diagnosis is often suspected even without any laboratory examinations, but rarely is it possible to be sure of the diagnosis on clinical observations alone Hence before starting a patient on a life-long program of liver therapy, all uncertainty about the diagnosis should, if possible, be eliminated Clinical observations, plus a few laboratory examinations, make this possible

Laboratory Aids in Diagnosis

I Hemoglobin and red-cell determinations The number of red cells is more diminished than the amount of hemoglobin and hence the color index is above one The blood film shows marked changes in size and shape of the red cells (anisocytosis and poikilocytosis), also polychromasia and punctate basophilia

II Leukopenia and reduction of blood platelets are almost constant.

III Determination of the mean corpuscular volume nearly always demonstrates an increase in the average size of the red blood cells

IV A reticulocyte count should always be made before liver therapy is started Repeated reticulocyte counts after adequate doses of liver have been administered will always show in pernicious anemia a marked increase of reticulocytes If the liver is administered by mouth, the maximum increase will occur between the sixth and tenth days, after parenteral liver therapy the peak will be observed between the third and eighth days Not infrequently the diagnosis remains in doubt until the reticulocyte response to liver therapy is observed.

V The icterus index is usually above ten, and the indirect Van den Bergh test positive.

VI Gastric analysis If free HCL is present, a diagnosis of pernicious anemia is almost certainly incorrect.

Differential Diagnosis

Other conditions in which there may be a megalocytic hyperchromic anemia, difficult to distinguish from pernicious anemia, are sprue, idiopathic steatorrhea, certain anemias associated with pregnancy, and occasional cases of gastric carcinoma To reach a correct diagnosis in these cases the collaboration of the clinician and the laboratory worker is essential

Leaflet No 10 issued by the New York State Association of Public Health Laboratories

---

The Indiana State Clemency Commission has denied a parole to Robert Peterson who is serving a twenty-year sentence in the state prison for robbery of a South Bend physician Record of the case showed that the physician was called to the Peterson home at night by telephone, the call having been made by Mrs Peterson who said that a baby there was very ill On his arrival at the house the doctor was assaulted by Peterson and forced to turn over the money on his person Peterson was sentenced in the St Joseph County Superior Court March 9, 1934

British authorities find school children work faster and suffer less eyestrain when copying from a light yellow board than when copying from a blackboard. Blue chalk is used with the yellow board The continual alternation of the eye from the blackboard to the white paper and back causes the eyestrain

---

A surgeon operating on the arm was asked, "Why do they call that the 'funny-bone'?" "Because," he replied, "it borders the humerus"—*Selected*

ago the proportion of minimal cases in the total reported was 19 15 per cent. Since then it has never fallen below nineteen per cent nor reached twenty-one In 1937 20 5 per cent of the cases of pulmonary tuberculosis was minimal, 27 6 per cent moderately advanced, and 37 1 per cent advanced The remainder were reported without the stage of the disease being indicated

The State now has a sufficiency of beds in public tuberculosis hospitals More than ever we need to discover our active cases Recent research by the Division has revealed a new and important means of making such discovery It is one that requires no new organization nor the setting up of new apparatus Routine x-rays of the chest of patients admitted to general hospitals upon films supplied by the Division has resulted in the diagnosis of active pulmonary tuberculosis in a large number of patients admitted for other diseases The uncovering of unsuspected tuberculosis in such cases is not only a benefit to the patient himself and to his home community but is also a protection to the staff and the other inmates of the hospital

It turns out to be much more profitable to x-ray the adults admitted routinely to the hospitals than to x-ray positive reactors among school children In this group only 1/10 of one per cent will prove to have active adult type tuberculosis The examination of adult family contacts of active cases will provide forty-one times as many new cases as the examination of school children, or in other words each new case can be discovered at 1/41 of the expense in dollars and in effort. At a time when there are so many family contacts still unexamined, it seems unnecessary to spend public money in combing schools

Finding and Treating Syphilis in Pregnancy

A conference at the New York City Health Department headquarters on April 6 considered the recently enacted prenatal blood examination bill and its relation to hospital and clinic practice Physicians, nurses, hospital and clinic superintendents, medical social workers, and other interested persons participated

The following pertinent paragraph from the Twomey-Newell Bill was read "Every physician attending pregnant women in the state during gestation shall in the case of every woman so attended, take or cause to be taken a sample of blood of such woman at the time of first examination and submit such sample to an approved laboratory for a standard serological test for syphilis"

The official form, 417V, for report of a venereal case, has been slightly modified by adding a question as to pregnancy The response to this new question will enable Health Department statisticians to properly record the facts

The follow-up resources of the Department of Health are at the disposal of all hospitals and clinics in an effort to maintain continuity of treatment of all pregnant women with syphilis Arrangements are being made for setting up a central file of syphilis in pregnancy This will permit a careful check-up of pregnant syphilitic patients attending clinics for the required treatment Each syphilis treatment clinic will be asked to report at stated intervals the progress of all women under treatment.

Health Department nurses and investigators will not supplant existing normal follow-up machinery of any institution Such services are designed to supplement inadequate or unsuccessful follow-up, on request, or may be utilized if no follow-up is available

Assistance and suggestions for harmonious cooperation in the effort to control congenital syphilis are welcomed

* * *

The Bureau of Social Hygiene of the Department of Health has summarized the following approved procedures for the management of syphilis in pregnancy and congenital syphilis

1 The recently enacted prenatal examination bill, now in effect, requires that every physician attending a pregnant woman take a sample of her blood at the first examination, and submit such sample to an approved laboratory for a standard serological test for syphilis

2 Every pregnant woman should have a complete physical examination at her first visit, the examination to include adequate history and serologic examination for syphilis If report is inconclusive, test should be repeated

3 Confirmatory evidence of syphilis in husband or other children should be sought when a Wassermann is reported positive.

4 Treatment of syphilis in pregnancy should begin as soon as the diagnosis is made and should continue through pregnancy to delivery Arsphenamine and neoarsphenamine are the drugs of choice.

5 A woman known to be syphilitic should be treated each time she is pregnant. Previous treatment and negative serological results should not deter the physician from administering antisyphilitic treatment.

6 Antisyphilitic treatment of the mother should be continued after the delivery of the child Husband and other children who require treatment should receive the same

7 A child born of a syphilitic woman should not be treated until a definite diagnosis has been made clinically, roentgenologically, or

tive Samuel B Pettingill, Democrat, Indiana, told the members present that the scheme of Senator James Hamilton Lewis of Illinois to secure federal control of the practice of medicine would place every physician in the United States on the payroll of the federal government and make the medical and allied professions subservient to the dictation of bureaucrats at the expense of the health of the people

THE APRIL MEETING of the Women Physicians' League was held April 25, at the home of Dr Enid C Brown

IT IS REPORTED THAT A few physicians are collecting annually less than $1,800 of gross income If this be the case such physicians are requested to contact the President of the Society, Dr Guess, who will bring the matter before the Comitia Minora for study

A SPECIAL MEETING of the Buffalo Academy of Medicine was held on May 4 at the Buffalo Museum of Science The program

Symposium on Endocrinology

1 "The Present Status of the Physiology of Sex Maturation," (Illustrated) by D K Kitchen, M D, Detroit, Mich

2 "Concepts Regarding the Clinical Application of the Anterior Pituitary-like Hormone," by R L Schaefer, M D, Detroit, Mich

Fulton County

DR IRVING W POTTER was the speaker at the meeting of the Medical Society of Fulton County held at Hotel Johnstown on April 21 His subject was "Version and Breech Extraction" Slides were used to illustrate his paper

DR. PAUL B BROOKS, deputy commissioner of the New York State Department of Health, was guest of honor at the annual Fulton-Montgomery District Health Officers' dinner at Hotel Johnstown, on April 27

Genesee County

DR GEORGE S YOUNG turned in his resignation as city physician of Batavia at the Council meeting on April 20, after holding the position since January 1 Dr Homer A Harvey was appointed to succeed him to the $1,500 a year position Dr Young explained that he desired to devote more time to private practice

Herkimer County

THE SECOND OF A SERIES of postgraduate lectures was given at the North Washington St. School, Herkimer, on April 28 Subject "The Surgical Aspects of Thyroid Diseases" by Dr John Mulholland, Assistant Clinical Professor of Surgery, New York University College of Medicine

Kings County

SUPREME COURT JUSTICE John M McCooey and Dr Frank L Babbott, president of the Long Island College of Medicine, were the guest speakers at the fifty-eighth annual dinner of the college's Alumni Association on April 30 in the Columbus Club About 350 persons were present

Justice McCooey spoke of the valuable service given by members of the medical profession Dr Babbott praised the city Department of Health for its cooperation with the college through the new Red Hook-Gowanus Health Center Stating that there were 451 students in the college ten years ago and 361 now, Dr Babbott pointed out that small classes provided greater opportunities for individual instruction

Dr Herbert C Fett, president of the Alumni Association, was toastmaster With him on the dais were Dr Eugene Marzullo, elected to succeed Dr Fett as president and the other newly elected officers

They were Dr Henry J Feaster, vice president, Dr Sutherland Miller, treasurer, Dr William T Daily, secretary, Dr Fedor L Senger, historian, and Dr George Freeman, assistant historian

Also on the dais were Supreme Court Justice Philip A Brennan, Dr Jean A Curran, dean of the college, Dr Nathaniel P Rathbun, alumni representative to the board of trustees, Dr John B d'Albora, president of the Kings County Medical Society, and the two oldest alumni, Dr Frank E West of the class of '76 and Dr Joshua M Van Cott, '85

THE ANNUAL DINNER DANCE of the Italian Medical Society of Brooklyn was held at the Hotel St. George on April 28 More than 500 persons prominent in medical and Italian circles were present

Monroe County

TO THOSE RELATIVES and friends who like to fondle somebody else's baby the Child Welfare Committee of the Monroe County Medical Society has addressed a warning in a report issued as part of the observance of Child Health Day "Indiscriminate kissing should not be permitted," in the opinion of the committee of which John Aikman, M D, is chairman Adoption of a program of standard

Medical News

Bronx County

THE THIRD ANNUAL Bronx Better Health Week was held in the last week in April Dr Emil Koffler, president of the Bronx County Medical Society, presided at the opening meeting In his address, he urged education as a means of spreading the principles of health among the public.

"In every community," he said, "we have a group of physicians, dentists, pharmacists, educators, public health and welfare workers Why not look to them for guidance? Let us make of better health week a permanent institution, let us make better health a reality"

Dr Louis A. Friedman, district health officer of the Tremont Health Center, urged parents to take advantage of the immunization service against measles, diphtheria and other communicable diseases

Other speakers were Dr Clarence J O'Connor, who spoke on "The Value of a Health Examination," and Dr Harry L Jones, whose topic was "The Value of a Semi-annual Dental Examination"

Free health films were shown every afternoon in the Veterans' Hall These films were

"Sight Saving," "Once Upon a Time—Safety," "Behind the Shadows," "History of My Life by Tee Bee," "Foot Health," "Pneumonia," "For All Our Sakes," "Preventing Blindness" and "How Teeth Grow"

Broome County

DR FRANK J HITCHCOCK, Broome County coroner, died on April 25 at the Binghamton City Hospital after a brief illness

Cayuga County

DR. ROSS E HEROLD, Clinical director, Willard State Hospital, spoke at a meeting of the Medical Society of the County of Cayuga on April 17 "Mental Problems Met in Every Day Practice"

At the monthly meeting on March 17 William A. Groat, president of the New York State Medical Society, gave a paper on "Recent Advances in the Treatment of Diabetes"

Clinton County

DR. FRANCIS B TRUDEAU was the principal speaker at the annual meeting of the Clinton County Committee on Tuberculosis and Public Health on April 28 at the courthouse in Plattsburgh

Other speakers were Miss Marie Goulett, representing the State Committee on Tuberculosis and Public Health, and Dr Joseph P Garen, New York State Health Department Official for Clinton, Essex, Franklin, and Hamilton counties

Columbia County

CONGRATULATIONS HAVE BEEN received by the Hudson Chamber of Commerce from T F. Cunneen, Manager of the Insurance Department of the United States Chamber of Commerce, upon Columbia County winning the first award among counties in its geographic division, namely, the Northeastern, in the 1937 Inter-Chamber Rural Health Conservation Contest.

Credit for the exceptionally fine record in health conservation in Columbia County is given to the able and conscientious supervision of Dr Louis Van Hoesen and his staff of the Department of Health

This is the second consecutive time Columbia County has won the contest

Erie County

DR. HENRY F. VAUGHAN, Detroit Health Commissioner, was the principal speaker at the meeting of the Medical Society of the County of Erie on April 18 He described a study he has conducted for a number of years to encourage the physicians of Detroit to give more consideration to preventive medicine in the field of public health to be practiced along with curative medicine in their own offices Approximately 1200 physicians in Detroit are a part of this cooperating unit, and a marked decrease in mortality rate is recorded.

THE FOLLOWING COMMITTEE has been named by Dr James L Gallagher, Chairman on Legislation, to publicize to the laity and to advise physicians and the clergy on the provisions of the amendment of 1938 to the domestic relations law, effective July 1, in relation to examinations and serological tests of applicants for a marriage license Drs Norman W Elton, William O Hill, Roy L Scott, John T Donovan and William A Barr

AT THE ANNUAL BANQUET of the alumni association, School of Medicine, University of Buffalo, held April 23, U S Representa-

profession was delivered by Dr Charles Gordon Heyd, professor of surgery at Columbia University, at the third annual dinner of lawyers and doctors of Onondaga County in the Onondaga Hotel on April 30

More than 250 lawyers and doctors were present Dr Oliver W H Mitchell, a professor at Syracuse University College of Medicine, presided as toastmaster

As past president of both the New York State Medical Society and the American Medical Association, Dr Heyd declared

The inevitable consequence of assuming a compulsory health insurance scheme is an increase in morbidity and in the number of hospital days throughout the country

It is impossible to set up any state system of medicine or compulsory health insurance without creating a class of bureaucrats whose self interest maintains them in office. And who would pay for such a socialized system? The service would cost at least ten per cent of the national pay rolls annually

THE PROGRAM OF THE ONONDAGA COUNTY Medical Society on May 3 was as follows Dr Wm F Snow, Medical Director of the American Social Hygiene Association spoke on 'Comment on Modern Treatment of Syphilis and Gonorrhea," and Dr William A Brumfield, Director of the Division of Syphilis Control of the New York State Department of Health, talked on Certain Clinical Aspects of Syphilis"

THE SYRACUSE ACADEMY of Medicine on May 17 listened to this program E C Reifenstein, Jr, and Eugene Davidoff spoke on "The Present Status of Benzedrine Sulfate Therapy" R J Mearin on "Insulin Therapy in Dementia Precox," and P J Rakov on "Treatment of Varicose Veins and Varicose Ulcer—Experiences in 800 Cases"

STANDARDS OF MATERNAL AND infant care in hospitals that may be incorporated in the city sanitary code will be drawn up by the maternal welfare committee of the Onondaga Medical Society

PLANS FOR THE SYRACUSE Medical Alumni Reunion on June 6 and 7 are complete. The scientific sessions will be held in the Medical School auditorium and the building will also lend itself to the exhibits The program follows

June 6

1 Inspection of completed Medical College.
2. Scientific Exhibits on syphilis and pneumonia.
3 Doctors' Arts and Hobbies exhibit.
4 Lunch at Medical College.
5 Dr Russell Cecil—Treatment of Pneumonia
6 Dr F L. Jennings—Pneumothorax in the treatment of pulmonary tuberculosis, recent trends and reviewing 25 years' experience
7 Annual banquet—Hotel Onondaga.

June 7

8 10 A M—Dr John H Stokes Treatment of Syphilis
9 Dr Harold E. B Pardee Treatment of heart disease during pregnancy and labor
10 Lunch at Medical College
11 2 P M—Dr John Corbett Rectal Fistula, illustrated.
12 Dr Charles Squires Diagnosis and Treatment of Acute Surgical Emergencies
13 Informal dinner at Hotel Onondaga.
14 Medical Revue.

Oswego County

THIRTY-FIVE MEMBERS OF the Oswego County Medical Society attended the dinner meeting at the Elks' Club on April 27, when Dr Doran J Stephens of University of Rochester School of Medicine was guest speaker Dr K Wood Jarvis, president of the society, presided and introduced the speaker, who presented a paper on "Practical Tests for Vitamin Deficiency and Their Clinical Application"

At the meeting at Oswego County Sanatorium in Orwell on May 9, Dr Howard Fox, skin specialist of New York University, was the speaker

Queens County

THE QUEENS COUNTY MEDICAL Society observed National Child Health Day with talks on health and a display of exhibits and posters at the Medical Building on May 2

The speakers were entertained at a luncheon at Forest Hills Inn by the child welfare committee of the society

There were exhibits and posters on child hygiene, prenatal care, pneumonia, syphilis, tuberculosis, stillbirth and premature births, diphtheria and mental hygiene, besides children's paintings presented under the auspices of the Federal Art Project.

X-rays on tuberculosis were shown under the sponsorship of the Queensboro Tuberculosis and Health Association

Dr Henry C Eichacker, president of the Queens County Medical Society, spoke on "Child Health from the Obstetrical Standpoint" Dr Carl Boettiger, president of the Queensboro Tuberculosis and Health Association, spoke on "The Value of Periodic Health Examinations for Children."

Dr Harold Mitchell, director of the Astoria Health Center, Dr Walter C. A Steffen, director of pediatrics at Queens General Hospital, Mrs Elmer Kleefield,

methods by which private physicians successfully may carry out necessary procedure for the protection of preschool-age children was announced by the committee which cooperated with state and local health agencies The committee's conclusions are based on recommendations of the Immunization Procedure Committee, American Academy of Pediatrics

Examination by a physician once each month during the first year of life was urged by the committee. Young children, especially, should be guarded against disease, and visits to the physician early in life may bring needed protective measures, it pointed out.

DR. WILLIAM S DEAN has been appointed police and fire surgeon of Rochester, at $3,456 per annum

DR HENRY T WILLIAMS, eighty, dean of the medical profession in Rochester, died on April 26 of a heart attack

DR. LUIGI BALDUCCI, fifty-five, physician to many Rochester Italian societies and captain in the Italian Medical Corps in the World War, died at his home on May 2

Nassau County

A DISCUSSION OF MODERN public health problems featured a meeting of the Medical Society of the County of Nassau at the Bar association clubhouse, Mineola, on April 26 Dr W G Smillie, head of the department of public health at Cornell University Medical College spoke on "The Present Day Concept of Public Health." Dr Earle G Brown, Nassau county health commissioner and his deputy, Dr William H.Runcie, led the general discussion following Dr Smillie's presentation.

The Nassau Review-Star announces that its "Distinguished Service Award" for 1937 will go to Dr Benjamin W Seaman, eminent surgeon and member of the board of managers of Meadowbrook hospital It says Dr Seaman's services to Nassau county were found to extend over a period of more than 20 years of sustained interest and influence in promoting the erection of hospitals, enhancing the facilities for medical services to the needy and contributing to the elevation of the health of the people. He was an active supporter of the Mercy hospital drive last year and was the recipient of high professional honors in recognition of his prestige in the field of surgery

THE SATISFACTION WITH WHICH the Medical Society of the County of Nassau has greeted the organization of the new county health department is reflected in the *Nassau Medical News*

In refering to the appointments of Dr Earl G Brown as health commissioner and Dr William H Runcie as deputy health commissioner, the *Medical News* said,

Doctor Runcie brings to the new department the experience of many years of efficient public health work in Nassau county

In Dr Brown we have a man whose merit is best vouched for by his elevation to the presidency of the Conference of State and Provincial Health Authorities of North America, to the presidency of his county and state medical societies and to the governing council of the American Public Health association.

With this combination of executives we look forward confidently to the realization of our long cherished ambition to see developed in Nassau county a health department which, with the co-operation of the practicing physicians, will make a real contribution to the national program of making modern preventive medicine available to all the people without regimentation of the medical profession

New York County

DR JOSEPH I SINGER was elected president of the Washington Square Medical Society, to succeed Dr Bonnard Teegarden, at the annual meeting of the society on April 26 at the Scudder School Auditorium

Election of officers and reports of committees preceded the program, dedicated to the memory of the late Dr Harlow Brooks, prominent member of the association who died in April 1936

Dr John J Moorhead, colleague of the late physician, offered reminiscences of the life of Dr Brooks and read a tribute to him Dr Emanuel Libman, by invitation, presented the Harlow Brooks Memorial Lecture About 150 doctors and friends attended.

Oneida County

DR P L TURNER, a cruise passenger on the Puerto Rico liner *Borinquen*, and Dr F C Devondorf, ship's surgeon, performed an operation at sea on the chief officer of the Royal Netherlands liner *Luna* on April 23

Thirty hours out of San Juan, the *Borinquen* received a call for medical assistance from the *Luna* The *Borinquen* sighted the *Luna* soon afterward and the two surgeons were rowed to the other ship, where they operated successfully on the chief officer, J L Booker

Onondaga County

A VIGOROUS ATTACK against government intervention in either the legal or the medical

Hospital News

Nassau's Critical Hospital Emergency

NASSAU COUNTY IS FACED with a serious shortage of hospital facilities, a lack steadily increasing which demands immediate action, according to the *Nassau Medical News*, journal of the Nassau County Medical Society

Citing the need for at least 800 more hospital beds in the county the *News* points out that there is a great demand for institutional care which cannot be met despite the erection of new buildings in the past fifteen years

In 1923 the society, seriously alarmed at the inadequacy of hospital facilities in the county, undertook an extensive study of the problem. At that time, with a population of about 170,000, Nassau possessed 120 available beds against a theoretical minimum need of 510, an indicated shortage of 390 beds

Shortage Has Grown

Since then the bed shortage has grown in proportion in spite of the erection of the North Country Community Hospital in Glen Cove, the South Nassau Communities Hospital in Rockville Centre, the Long Beach Hospital and Meadowbrook Hospital In the same period the capacity of Nassau Hospital has more than doubled.

In the opinion of medical authorities there, according to the article, the situation is even worse than the rough figures would indicate, because of changing habits of the people and improved medical skill, making necessary greater use of the hospitals Whereas in 1922 Nassau residents used the hospitals for less than twelve per cent of the county's obstetrical cases, last year fifty-two per cent of the recorded births occurred in hospitals

Advances in the treatment of cancer also have increased demands on the hospitals Because of the lack of money to build greatly needed new hospitals, the medical journal believes, the only possible immediate remedy for the situation is to make more economical use of the institutional facilities now available.

"If less than half of the people who need hospital care can find admission, the only intelligent thing to do is to select from the many applicants those who are most in need of care or for whom care would do the most good," according to the *News* "Cases admitted to ward care should be selected strictly on the basis of medical need and all other considerations should be subordinate.

"It should be remembered that every patient sent to a hospital who could be cared for at home is denying a bed to some other patient whose very life might depend on prompt admission."

Doctors Asked to Aid

Turning to suggestions for "making a bad situation less acute," the *Medical News* advises doctors to refrain from seeking immediate hospitalization for a patient on the grounds that the case is an emergency unless a few days' delay would actually jeopardize the life or future health of that particular patient.

Physicians also are warned to refrain from seeking admission of patients solely for convenience or because of friendship or social or business considerations A patient seeking such a favor should be "told that to grant it might mean the equivalent of passing a death sentence upon some one whose hospital need is greater but who does not have a 'friend at court.'"

It is advised that immediate steps be taken to include in the budget of the County Department of Public Welfare funds to be used for the medical and nursing care of persons who would be considered financially eligible for admission to charity wards but not eligible to receive other forms of material relief

Such an arrangement, providing home care for many of the sick, would cost about $10 a week per patient, as against more than $6 a day for hospital care. Hospital patients could be transferred to home care as soon as the dangerous phases of their illness were passed

president of the Medical Auxiliary, and Miss Henrietta Additon, director of welfare and hygiene at the World's Fair, also spoke

DR. S MEREDITH STRONG, SR., representing the Queens County Medical Society, spoke at the Blue Fair Restaurant, Flushing, under the auspices of the North Shore Pharmaceutical Association, Inc., on May 2

He urged cooperation in the fight against narcotic addiction

This, he said, is costing the nation millions of dollars every year More than 100 persons attended the dinner

Dr Strong also urged the pharmacists to cooperate with the physicians and the manufacturers of drugs, in reducing the cost of illness

THE ANNUAL DINNER OF THE Queensboro Surgical Society was held on April 28 at the Forest Hills Inn About 100 members and their guests were present. Following the dinner, the open meeting was held at the Queens County Medical Society Building The speaker was Dr John E Jennings, whose subject was "Modern Management of Cancer of the Breast."

DR. JOSEPH WRANA, president-elect of the Queens County Medical Society, opposed Dr Milton Malev of the Bronx, in a debate on "Whether Socialized Medicine Should Be Encouraged in the United States," at the Men's Club meeting in the Jamaica Jewish Center, May 11

DR SIMON R BLATTEIS, clinical professor of medicine at New York University, addressed the Medical Society of Queens County on "An Epidemiological and Clinical Analysis of Brill's Disease" at the County Society Building on May 6

DR MILTON H MORRIS was installed as president of the Rockaway Medical Society at a dinner at the Inwood Country Club on May 12

Rensselaer County

SCIENTIFIC PAPERS WERE READ by members of the medical and surgical staff of the Troy Hospital at a meeting of the Rensselaer County Medical Society in the hospital on April 12

Papers were read as follows "Carcinoma of Larynx," by Dr A J Hambrook, "Osteomyelitis of Femur," Dr M E DeLuca, "Meningitis," Dr J J Quinlan, "Some Interesting Dermatoses," Dr F J Fagan, "Stricture of Esophagus at Level of Larynx, Gastrostomy," Dr R. J Doody, and "Suppurative Parotiditis Complicating Pregnancy, Delivered by Cesarean Section," Dr O P Smith

A resolution of regret on the death of Dr Ira M Garrison was adopted

Rockland County

MEMBERS OF THE Rockland County Medical Society and police chiefs of the county were given instruction in first aid methods in traffic accidents by Dr Donald Gordon on April 27 The police chiefs were guests of the doctors at a meeting of the society at the New York Reconstruction Home, West Haverstraw

Speaking on "The First Hour of Injury," Dr Gordon not only explained the methods of first aid for various types of injuries but gave demonstrations of dressings, assisted by Chief of Police Joseph Vilord of Suffern, Chief John G Spissinger of Haverstraw, Chief Charles Leo Lunney of Spring Valley and Constable James Campbell of Stony Point Dr John Killifer of the Reconstruction Home volunteered to act as "patient."

Dr Gordon's talk covered nearly all possible types of injuries in traffic accidents, from simple shock to neck and spine fractures, and his instruction throughout his address was not to move the patient unless absolutely necessary, and not under any circumstances until someone who knows the proper method of moving him is present to give instructions

One of the most important considerations after an accident, he said, is to send for a doctor and tell him what to expect so that he may know what instruments and equipment to take with him

Warren County

DR TINSELY R HARRISON, of the Vanderbilt University School of Medicine, addressed the Glens Falls Academy of Medicine on April 29 on "Cardiac Dyspnea" The discussion of his paper was opened by Dr Irving R Juster Other physicians joining in the discussion were Dr Carl R Comstock, Dr Walter S McClellan, Dr Arthur Wright, and Dr James B Shields. Approximately seventy-five physicians were present. Preceding the scientific presentation in the auditorium, a dinner was served at The Queensbury in honor of Dr Harrison

Wayne County

ELMER G BUTTS, county welfare commissioner, and Dr George Allen of Clyde, physician to the County Home, were chief speakers at the monthly meeting of the Wayne County Medical Society at the County Home on April 12

THE MEDICAL STAFF of the Salamanca Hospital have voted to close the doctors' offices on each Thursday afternoon and evening Similar practices have been in vogue in Olean, Jamestown, Bradford and other nearby cities

For any emergency the hospital is to be phoned, where a physician will be on call each Thursday to take care of any immediate needs

THE JAMESTOWN CITY COUNCIL is investigating the financial affairs of the Jamestown General Hospital, as a result of disclosures made with the arrest of Archie H Luntz, head of the Empire Collection Agency, in connection with his collection of hospital accounts and alleged failure to turn over to the hospital approximately $1,200 from such accounts The transactions occurred about 1934 During 1936 and 1937 the hospital showed the best cash picture it has ever shown.

It is also announced that the state auditor, who has been working on the hospital accounts for several months, has uncovered documentary irregularities in connection with Luntz' accounts with the hospital but that lacking positive proof, nothing has been done until such proof could be secured The reason for the delay was that, if confronted, Luntz might have told hospital authorities he had paid over the money to Mrs Beatrice Carlson, who is now serving a prison term for defalcations amounting to several thousand dollars of hospital funds

TRINITY HOSPITAL, a private institution of 100 beds in Brooklyn, faces demolition under plans being advanced by the borough to create a public square on the site and speed the flow of traffic to the Long Island parkways

Officials of the hospital were taken aback when questioned concerning the future. Miss Elizabeth Nanes, superintendent, refused to believe the report. Why, she said, a $250,000 wing with additional bed space, laboratories and modern equipment was opened just ten years ago

Raymond V Ingersoll, Borough President, revealed the project in a communication to the Board of Estimate He explained that the scheme originated in a street plan of 1911, two years before Trinity Hospital opened It was endorsed by the borough planning board and has been referred to the City Planning Commission

DR. GEORGE GRAY WARD of the Woman's Hospital (New York City), was honored on April 18 at a reception marking his twenty years of service as chief surgeon of the institution The reception, held at the hospital, was attended by the board of governors, the assistant board and the entire surgical staff

Dr Ward's request that he be relieved of the arduous duties of chief surgeon was granted reluctantly by the board, which immediately appointed him chief surgeon emeritus and consulting surgeon He will continue to teach at the hospital, it was announced

A silver bowl was presented to Dr Ward on behalf of the board of governors by Grenville Lindall Winthrop, president of the hospital

A STUDY IN THE BLOOD-LETTING and "hocus-pocus medical practices" of the Middle Ages, designed as a horror sequence and titled "The Foibles of Medicine," was approved last month by the Municipal Art Commission for display in the waiting room of the Queens County General Hospital Companion panels of the mural series show Koch, Pasteur, Rontgen and Jenner advancing the cause of modern scientific preventive medicine

William Palmer, thirty-one-year-old WPA artist, created the murals under the Federal Art Project. He said of them "Originally I wanted to do foibles of medicine for the entire room, but then I decided it would be more constructive and educational if I offered it as a contrast to preventive medicine and let the public draw its own conclusions"

THE COMMON COUNCIL OF ONEIDA, in the interests of economy, has notified the welfare department not to send relief patients to the municipal hospital who can be cared for at home

TO COMMEMORATE THE OPENING of a greatly expanded department of physical therapy at Mt. Sinai Hospital (New York City), the institution was host to specialists

Newsy Notes

When He Attempted to discipline two workmen because they were not following his orders on the Brooklyn State Hospital, they told him that they were taking orders from the union and not from him, Isaac Penner, electrical contractor, testified on April 29 at the resumption of hearings in injunction proceedings against Local 3 of the International Brotherhood of Electrical Workers in Federal Court in New York City

Mr Penner, who is one of the principal witnesses for the National Electrical Manufacturers Association, which is seeking to enjoin the union from continuing its boycott against materials manufactured outside of New York City, said that the Brooklyn State Hospital job was being constantly sabotaged

The men installed conduits and outlets in the wrong places despite the fact that they had been told to follow blueprints for the work, he said. When these errors were discovered, he continued, he had to pay for having them corrected His efforts to supervise the work personally was effectively stopped by the union, he testified, by orders sent to the men to quit work, if he stayed on the job more than an hour a day

•

The New York City Hospital Department plans to start in June a program for making blood available for transfusions to needy patients without cost. The equipment and refrigerators for storing blood will be installed in fourteen city hospitals by June 1 At first these will be stocked with blood from professional donors, but later it is planned to use blood contributed by relatives of patients receiving transfusions

Although the Number of patients and the cost of their care increased, the New York Hospital was able to reduce its deficit last year for the third successive year, according to the 166th annual report. The hospital's deficit of $250,515 was 30 per cent less than the deficit for 1936, the report said There was an expenditure of $4,190,795 to care for 19,551 bed patients and 49,157 outpatients

•

What a New York Newspaper calls "the world's first brain wave clinic" has been established at Bellevue Hospital It is described as follows by Karl Bostrom in the New York *Post*

Although it has been known for several years that the brain produces electrical waves somewhat like radio waves, the Bellevue brain wave clinic is the first established in a major hospital for the routine diagnosis of brain conditions

The waves are called Berger rhythms, after the discoverer, Dr Hans Berger of Jena, Germany Considerable research on brain waves is now under way in many American medical schools and in Europe. Dr Joseph Owens is in charge of the Bellevue research

At present the Bellevue clinic is used as a check on other diagnostic findings in brain tumor and epilepsy cases Experience to date has shown that the brain wave receiver, or electro-encephalograph, can place the exact position of brain tumors in eighty per cent of the cases This is much more certain than other diagnostic technics

This is more accurate than the older method of drilling a hole in the skull, tapping the fluid, filling a brain ventricle with air and taking an x-ray

Such an operation is not required in the brain wave diagnosis This method requires only loosely applied metal electrodes slightly smaller than a dime. From these electrodes wires lead to the receiver

The pulsations may be heard over a loud speaker, but they are usually recorded on a roll of photographic paper The wave patterns vary with every normal and diseased person, with every condition, and for different sections and layers of the brain Brain tumors have distinctive pulsations

Because of the high amplifications required in detecting the brain waves, the patient, the receiver and operator are inclosed in a small room. The patient is separated from the operator and receiver by a partition The unique part of this small room is that the walls, ceiling and floor are lined with copper screen which eliminates all other radio waves and electrical static.

Not only is the brain wave detector expected to be of value in determining the position of brain tumors, but also in determining the exact nature of diseased brain conditions of many other types

There is a possibility that the clinic could pay for itself by disproving compensation disability claims due to brain conditions as a result of injuries

Electrical waves are now known to be given out by other parts of the body Recent research at Yale has shown that cancer in mice can be detected electrically several weeks before it becomes evident by other diagnostic methods

Counsel, Medical Society of the State of New York

Lectures and Sale of Tablets as the Practice of Medicine

In a case decided recently by the highest court of one of the Western States, the Court was called upon to interpret the extent to which a so-called Basic Science Act could be invoked to put an end to the activities of unlicensed medical practitioners *

According to the charges against the defendant she had advertised herself as an assistant and staff lecturer for a certain Dr R of another state and she had conducted certain activities without a valid certificate of registration in the basic sciences It seems that she had advertised a series of free daily lectures at a certain hotel, and that during those lectures she had solicited a number of women to attend a lecture course which followed the free lecture and that in connection therewith fees were collected During these lectures, it was charged, the defendant described certain products and told of their uses and properties Circulars were distributed regarding the products, and they were announced for sale and actually sold by the defendant. The charges further indicated that she had derived a fifty-five per cent commission from such sales, and the balance of the moneys were turned over to Dr R, who was an osteopath in another state

One of the circulars was referred to as being entitled "How to Improve Your Health and Personal Appearance," and as containing a discourse on the treatment of anemia by the use of powdered red bone marrow and spleen Apparently she sold tablets claimed to contain red bone marrow and spleen which were labeled "Useful in Secondary Anemia" She was also charged with distributing circulars containing statements regarding dysfunction of the thyroid and ovarian glands, and the advantages to be derived from the use of glandular food In connection with the latter literature, and the lectures, it seems, the defendant sold certain female hormone tablets

The conduct above outlined was made the basis of charges against the defendant of having committed a public offense in violation of the State Basic Science Act. The defendant applied to the lower Court for a dismissal of the charges contending that even if true they failed to make out a valid case against her The trial Court dismissed her application and the question was taken to the Appellate Court upon a certified question to ascertain whether the charges in fact set forth a public offense under the law

The Basic Science Law in effect forbade the practice of healing without a certificate of having passed an examination by the board of examiners in the basic sciences The basic sciences were defined as including anatomy, physiology, pathology, bacteriology, hygiene, and chemistry The law defined the practice of healing as including "any persons who shall in any manner for fee, gift, compensation or reward, or in expectation thereof, engage in the diagnosis, analysis, treatment, correction or cure of any disease, injury, defect, deformity, infirmity, ailment, or affliction of human beings, or who for any fee suggests, recommends, or prescribes any medicine or cure thereof"

The defendant contended that there was no relation between the requirements of the basic science law, and the protection of the public as applied to her situation, and that, therefore, if that law prevented her from legally doing what she had done, her constitutional rights were violated The Appellate Court, however, sustained the charges against the defendant, and answered the certified question in the affirmative, stating in its opinion

With the defendant's contention we cannot agree It is essential to the public health and safety that persons who, for compensation, are suggesting, recommending, or prescribing medicine or treatment for the correction or cure of human ailments have a basic understanding of the subjects required by the basic science law In our opinion it is within the police power of the state to so require. According to the information lodged against her, the defendant induced women to come to lectures for which she charged a fee and for those who had menstrual troubles she suggested and recommended tablets which she had for sale for correction and cure of their affliction It is our view that her conduct came squarely within the basic science law and that the requirements of that law are germane to the safety and health of the public in the treatment of such

* State v Mielke, 277 N W 420

in this field of medicine from the Eastern coast in an all-day scientific session on April 13 This meeting was held as the annual spring session of the Eastern section of the American Congress of Physical Therapy

PREVENTION OF DISEASE was urged in an address by Dr William Paul Brown of the State Education Department at a meeting of the Cohoes Hospital staff on April 6 Dr Brown's subject was "The School and Health"

THE MEDICAL STAFF of St. Mary's Hospital of Brooklyn held its annual reception and dinner-dance on April 20, at the Hotel St. George. More than 2,000 friends and patrons of the hospital attended. Proceeds will go to a fund for the replacement of scientific instruments for the use of doctors in the hospital.

•

THE PHYSICIANS' STAFF of the Rome and Murphy Memorial hospitals heard an address by Dr Robert K. Brewer, professor of biological chemistry at Syracuse University at the annual dinner at the Elks' Club in Rome April 12

Dr Brewer's topic was "Biological Chemistry in Relation to Modern Medicine." He was presented by Dr George C Reid, president of the staff Forty members and guests attended

Improvements

THE CONTRACT FOR CONSTRUCTING the new out-patient building at the Hospital for Joint Diseases in New York City has been awarded Plans call for a building of fireproof construction, four stories, approximately 99 by 195, to cost in the neighborhood of $450,000

•

BEAUTIFICATION OF THE lower land lying south of Our Lady of Lourdes hospital main buildings in Binghamton with a sunken garden ninety by forty feet and a large grotto at the Susquehanna river and patterned after the groto at Lourdes, France, has been started through cooperation by St Mary's Home Boy Scouts and the Hospital Sisters of Charities

•

AN ACTIVE CAMPAIGN has been started in Schenectady to build an addition to the City Hospital The president of the medical staff states there are not beds enough to handle even a mild epidemic

• • •

ITHACA IS PLANNING AN addition to the Memorial Hospital, to cost $102,000, to be built in cooperation with the PWA

THE NEW VETERANS' HOSPITAL at Bath was dedicated on May 12

NINE ORGANIZATIONS COMPOSED of persons of Swedish descent have pledged themselves to raise at least $1,000 each toward the Brooklyn Swedish Hospital campaign for $250,000 building funds, it is announced by Col A W H Pohl, executive officer of the hospital

Members of all organizations reaching their $1,000 quotas will be entitled to a discount of twenty per cent in hospitalization charges for the next five years, Mr Pohl said

THE STEUBEN COUNTY BOARD of Supervisors are considering a plan to convert the Pleasant Valley Sanatorium into a county infirmary, at a cost of some $29,000 The old county infirmary at Bath has been condemned and the patients have been removed

THE NEW SOLARIUM at Corning Hospital is completed and was a feature of its exhibit to visitors on Hospital Day

At the Helm

THESE HOSPITAL OFFICIALS HAVE BEEN CHOSEN

Alfred Renshaw, to be president of the board of governors of Albany Hospital

Mrs Guy M Jones, to be president of the Schenectady City Hospital auxiliary

George A Buchanan, to be president of the board of directors of the Cohoes Hospital

Mrs J Roosevelt Roosevelt, to be president of the ladies' auxiliary of St Francis Hospital at Poughkeepsie.

Sifting the Good Out of Indian Medicine

FATHER HIPPOCRATES VISITED India over 2000 years ago, to see if he could learn something or other worth while, very much as our doctors take trips to Europe to study the hospitals and medical schools, and scholars say that he learned there how to perform surgical operations, including laparotomies cesarean sections, trephining, and even inoculating for smallpox—beating Jenner by quite a bit!

If this story is true, then modern medicine is following in good footsteps, anyway, in its effort to sift the vast system of Indian medicine, and to find what good it can in the huge rubbish-heap of superstitions and hocus-pocus that goes by the name of Ayurveda. Gold itself is often extracted in tiny particles from masses of ore, a few dollars to the ton, and if that pays, then we need not scoff at an honest attempt to find the grains of truth in a medical system that has served the swarming millions of India for thousands of years

One Lucrative Result

This sifting has been in progress for some fifteen years at the Calcutta School of Tropical Medicine, under the guidance of Lieut-Col R. N Chopra, and the investigators have made findings of considerable value. They have discovered that almost all our pharmacopoeal drugs, or equivalent substitutes, grow wild in great abundance in India, or can be easily made to grow there, such is the marvelous variety of climate and soil This has eventuated from studying the remedies of the old system and comparing them with our own, and will bring a lucrative saving to the people.

The men of modern medicine are being brought to favor the native plant products in place of more expensive imported ones, and Indian medical manufacturers are organizing to use them, so that a great reduction in the cost of medicines is likely, enabling the masses of the poor to have the benefits of modern scientific medicaments This is the most promising result so far Investigation of the Ayurvedic methods of treatment has not brought to light anything to replace what we already have Some have value, but are not superior, or perhaps equal, to those of western medicine. Many have been proved, under rigid tests, absolutely worthless, which is vitally important, too, if the people can only be convinced of it.

Our Own System a Curious Mixture

We may smile if we like at the ancient medical systems of the Orient as conglomerations of trash, but we must remember that our own boasted system is a growth Its roots reach back into remote dark ages as benighted as the Punjab, the Kongo, or, say, the back districts of Kentucky today Modern medicine is a curious blend of the old and new, remarks Mr B Mukerji, pharmacologist of the All-India Institute of Hygiene and Public Health at Calcutta

Side by side in our pharmacopoeia with the most up-to-date chemotherapeutic and synthetic remedies, are the century-old drugs from all over the globe—opium, nux vomica, hemp, datura, spices, mercury, etc., from India, cinchona from Peru, ipecacuanha from Brazil, strophanthus or kombe arrow poison from Africa, coffee from Arabia, digitalis from Great Britain, cocoa leaves from Peru, antimony from Greece, and hosts of others from various sources

The true scientist is a seeker after truth, and, as Mr Mukerji truly observes, his duty is to pick the best from every system, whether it emanates from India, China, or any other part of the world, and "to knit all the experience together in freeing humanity at large from the sufferings to which flesh is heir," Mr Mukerji is a loyal son of India, but he is a scientist too, and, as he sees it, "Modern science is like a furnace through which we need not fear to put our precious lore," for "the rubbish will be burnt up, but the purified and glistening treasure will remain"

Laugh That Off!

There is no bigotry in science, it accepts truth wherever found, and it is just as in-

ailments as those for which she sold and recommended her tablets and medicines Such being the case no constitutional right of the defendant is infringed upon.

Hemorrhage Following Removal of Tumor

A woman about thirty-five years of age consulted a physician who specialized in general surgery, for the purpose of undergoing a general physical examination following a hysterectomy which he had performed upon her sometime before. He found that she had a fatty tumor under her right arm which was the size of a walnut.

He advised its removal The patient consented and the doctor undertook the operation in his office, administering a local anesthesia of novocain The tumor was removed without difficulty and a sterile dressing applied There had been practically no bleeding The patient was sent home a short time following the operation, with instructions concerning aftercare. The same evening a man called the physician and told him that the patient was bleeding quite freely and sought advice as to what should be done. Since the doctor's office was a considerable distance from the home of the patient, he advised that she either go to the nearest hospital or obtain the services of a neighborhood doctor He also suggested that if any further difficulties developed he should be advised and he would do whatever he could

The doctor later ascertained that the patient did call upon a nearby physician who sent her to a hospital where a few sutures were inserted to stop bleeding which had developed Thereafter an action was brought against the doctor charging him with having improperly treated the patient and also charging him with having abandoned the patient in that he failed to respond to the call that he had received

The case came on for trial before a Court and a Jury and at the conclusion of all the evidence the Court on the motion of defendant's counsel directed the jury to render a verdict in favor of the defendant thereby exonerating him of all charges that he had failed to properly care for his patient

Claimed Improper Diagnosis of Cancer of Breast

A married woman, twenty-five years of age, was referred by a general practitioner to a physician who specialized in surgery, with a tentative diagnosis of cancer of the breast The surgeon examined the patient and found a hard lump along the outer upper part of the breast about the size of a tangerine, with some enlarged glands in the axilla. His diagnosis was carcinoma of the breast

An operation was advised and performed the following day, consisting of a radical mastectomy of the left breast. Prior to the operation no biopsy was taken but following the surgery, a specimen was taken to the laboratory of the hospital for pathological examination The section appeared upon gross examination to be typically a malignant growth When the pathological report was received it was to the effect that the patient had been suffering from purulent cystic mastitis The patient remained in the hospital about ten days and had an uneventful recovery

Some time later a malpractice action was brought against the surgeon in which the charge was made that he had performed an unnecessary operation upon the plaintiff on a mistaken diagnosis of cancer When the case was about to be reached for trial the plaintiff's attorney attempted to negotiate a settlement which led to a discussion of the case in which he was finally convinced that there was no merit to his action against the doctor and he, therefore, consented to discontinue the action

---

PNEUMONIA WILL NOT WAIT

"Pneumonia has come to be classed as an emergency just as truly as apendicitis is an emergency," declared Dr Peter Irving, secretary of the Medical Society of the State of New York, at a meeting sponsored by the Yonkers Health Department. He continued, "This changed aspect is due to the development of the use of serum as an adjunct in the treatment of some cases To be most effective, the serum must be administered within a day or two after the onset of the disease Hence immediate diagnosis has assumed greater importance, and this calls for recognition of symptoms by the physician, and before that, *recognition* of danger by the patient and his family"

"Who is that man over there snapping his fingers?"

"That's a deaf-mute with hiccups"—*Medical Record*

REVIEWED

Minor Maladies and Their Treatment. By Leonard Williams, M D Seventh edition Duodecimo of 439 pages Baltimore, William Wood and Company, 1937 Cloth, $3 75

The preparation of another edition of this interesting little book is evidence of its continued popularity Dealing with common disorders of the respiratory, digestive, nervous and endocrine systems, it makes no pretense to thoroughness or originality but rather to usefulness Innumerable old drugs are described which the reviewer had never even heard of before, while a fair warning is issued that one ought not to grasp at new proprietaries as immediately as they appear

Occasionally, the author makes rather surprising statements, as when he recommends that the inside of one's nostrils be washed once—or better—twice daily with soap and water precisely as one washes his face, or when he states that two very helpful signs in the diagnosis of diphtheria are the early absence of knee jerks and the presence of albumenuria, or when he remarks that if "a dyspepsia in a young woman proves intractable to the ordinary remedies, the probability is great that the cause will be found in the ovarian region" The book has a rich store of interesting stories and anecdotes

ANDREW M BABEY

Radiation Therapy Its use in the Treatment of Benign and Malignant Conditions By Ira I Kaplan, M D Octavo of 558 pages, illustrated New York, Oxford University Press, 1937 Cloth, $10 00

This work is intended to be used for reference by the student, general practitioner and specialist.

The book is planned in an orderly way The first chapter deals with the history and development of radiation therapy Following this an introductory chapter takes up the fundamentals of x-ray and radium dosage, and considers dosage from a physical and biological standpoint. Then follow two excellent chapters on general considerations in the use of radiation therapy and applied x-ray physics

A short chapter is also included which discusses briefly the physics of electrosurgical currents

The major portion of the work is given over to the use of radium and x-ray therapy in various diseases The diseases are considered according to the anatomic system which they involve The lists of conditions for which x-ray therapy may be used is exceedingly complete In most instances only one technique is given, since a full discussion of techniques possible for each condi-

tolerant and bigoted for the modern man to reject the old systems *in toto* as it is for their followers to reject modern medicine. We must not forget that the ancient peoples of the East were faced with the same life-and-death struggle that we have today, and the very fact that they survived the ravages of epidemics and disease is a silent testimonial to the measures they took to combat them Where are the most populous countries on the globe? Where has life won the most overwhelming victory over death? Is it not in the very lands where the medical systems seem most preposterous? It is vastly funny, but can we laugh it off? A system which has survived to such an extent the destructive influence of time, and a system which is still a living system in many parts of India, remarks Mr Mukerji, cannot entirely be brushed aside as unscientific, and he quotes Dr Hugh S Cummings, president of the U S Pharmocopeia Commission, as saying that "any system of medicine, or, for that matter, any ancient usage or custom that has held its own for generations usually has something at the back of it, no matter how little it appears to be supported by modern science."

Medicine's "Cradle" Is Rocking

India has been called "the cradle of medicine" The earliest mention anywhere of the medicinal use of plants was in the Rigveda, written about 4,500 B C, perhaps the oldest repository of human knowledge in existence The book of Ayurveda (or Science of Life), written in 1,000 to 2,500 B C, gave the definite properties of drugs and their uses and was the foundation stone of India's ancient medical science The Hindus understood the uses of 700 drugs, and about 700 or 800 B C Susruta wrote a treatise on surgery After India came under the power of Asoka (300 B C), the Buddhist religion brought in the idea of social service, hospitals were built in every town, the poor and sick were cared for, and Asoka issued an edict, still legible on a rock in Gujerat, commanding that hospitals be built throughout his vast kingdom The foundations of some of them can still be traced. So Indian medicine is certainly worthy of our respect

It may be that, as it stands today, nothing in it is worth saving Perhaps not But a greatly significant fact is that the modern scientific investigation and sifting that have been going on for fifteen years have caused a section of its practitioners to declare that they will accept only those teachings of Ayurveda which have stood the test of time and are found of value as judged by modern science. If this modern wing of the ancient system can be encouraged, it may come about that in time the rubbish will be sloughed off and Ayurveda be brought into step with modern knowledge.

Die-Hards Are Ready for a Fight

But the old guard of Ayurveda, the right-wingers, the last-ditchers, the die-hards, are not going to give up without a fight. By good fortune *The Journal of Ayurveda*, published in Calcutta, comes regularly to this desk, so we can learn their feelings at first hand Modern medicine, it seems, is a mere upstart, whereas Ayurveda is founded on "the experienced knowledge accumulated over centuries and centuries" And what is more, a mere investigation of the drugs of Ayurveda is worthless, for their curative value depends on their proper application, as we are assured in the following editorial, which may not be entirely intelligible to all of us

> The supremacy of Ayurveda, be it noted with care, is due not to any potent indigenous drug, but to the application of that drug in conformity with the principle of Vayu, Pitta and Kapha, and as such it is no use judging their worth and value through pharmacological standards of western medicine. Analysis, Synthesis, Active principle and Standardization are so many chimeras of Science to catch the center of the circumference of the Science of Life that Ayurveda is Elusion and Delusion is the rightful reward of the western medico that assays to judge by his jejune criteria of crude Laboratory methods Rasa, Virya, Vipaka and Prabhava of Drugs and their application to Doshas in conformity with the principle of Vayu, Pitta and Kapha is the correct criterion and medical vampires cannot vindicate Ayurveda on flimsy scales of pseudo-Science.

Far from being ready to give up, Ayurveda, as we are assured in another editorial, "dreams of a glorious future, when Ayurveda shall come to occupy its rightful position as the real system of medical relief of the world"

Well, after that, if we still insist on practicing what the Indian editor calls "allopathy," we can't say we weren't warned

NEW MACMILLAN BOOKS

Among the discoveries made during the past two decades, in the field of nutrition those related to Vitamin B_1 are perhaps of greatest significance It now appears that the chief function of this vitamin is to regulate the most fundamental of all life processes cell respiration. Because of the recent demonstration that many forms of neuritis and allied disorders are directly related to impairment of this process the present book will be of immediate interest to the clinician The authors presentation of the subject is unusual in that it gives the clinical application of laboratory findings for the use of the physician in his practice The book will be of interest also to the pediatrician as well as to the student of nutrition and of certain branches of chemistry *Ready in June Probable price* $5 00

A Macmillan Medical Monograph

VITAMIN B_1

(*Thiamin*)

AND ITS USE IN MEDICINE

By R R. Williams, Sc.D
and Tom Douglas Spies, M.D

The whole world knows of Dr Jackson, eminent American laryngologist and pioneer of the bronchoscope. His skill in removing foreign bodies from lungs and bronchial tubes, with the aid of his famous bronchoscope has brought patients to his Philadelphia clinic from far and wide. Dr Jackson bridges the gap between two ages in medicine. He has helped to make the modern age what it is not only by his invention, but also by his enlightened training of assistants to carry on his work. Few people, however, know the story of Dr Jackson s life—how he came to take up this humanitarian work, how his remarkable skill was acquired. In this book Dr Jackson tells, for the first time, his life story beginning with his early childhood and continuing through the successive stages of his brilliant career Handsomely illustrated with scenes from the author s life as well as with reproductions of his own paintings. *Ready in June Probable price* $3 50

THE LIFE OF CHEVALIER JACKSON

An Autobiography

Forkner—Leukemia and Allied Disorders

A critical interpretation of the known facts on the subject in relation to what is unknown. Considers the fundamental aspects of the problem with special reference to the pathologic physiology of the blood and blood forming organs and their bearing on the structure and function of the organism as a whole $5.00

Jones—Digestive Tract Pain

A complete study of pain referred from all levels of the gastro-intestinal tract in normal individuals describing the important phenomena underlying most digestive tract symptoms. Contains clinical observations having a direct bearing on the production of alimentary tract pain. $2.50

Strecker-Chambers—Alcohol One Man's Meat

"No thinking physician can read it without deepening his understanding of the problems of alcoholism and increasing his ability to cope with them, for the treatment suggested is directed not so much to the disease itself as to its underlying causes."—*Annals of Internal Medicine* $2.50

THE MACMILLAN COMPANY

60 Fifth Avenue New York

Boston Chicago San Francisco Dallas Atlanta

tion would be obviously impossible in a single volume

The chapter on complications and injuries following radiation is all too brief but here again in a book which is attempting to cover such a large subject in a single volume, one cannot expect too much detail

There is a short discussion of nursing requirements for patients under radiation treatment for malignant disease. This is a subject usually not sufficiently stressed, and is well worth reading

The organization of a cancer service in the municipal hospitals of the City of New York is described

Considered as a whole, this book is very handy as a reference, but because of the fact that it is necessarily brief, full use must be made of the rather ample bibliography Everyone doing x-ray therapy should have a copy of this book, and it is also understandable and useful for the general practitioner and specialist in determining types of cases which should receive radiation therapy

A L L Bell

Neurology By Roy R. Grinker, M D Second edition. Quarto of 999 pages, illustrated Springfield, Charles C Thomas, 1937 Cloth, $8.50

The reviewer admits an immediate prejudice in favor of a "Thomas" book, because of the beauty and technical substantiability of its workmanship Naturally this outer frame work has no direct bearing on the quality of its written contents This outer promise is fulfilled by a review of Grinker's book which possesses a uniform excellence.

The title *Neurology* is well-selected because it completely ignores the field of psychiatry

It is a large, detailed undertaking consisting of one thousand pages, thirty chapters, and 400 well selected illustrations In its revision new material has been added in the chapters dealing with the vegetative nervous system and the cerebral cortex. Unusual stress is laid on therapy A profusion of references, considered an absolute necessity in a modern text book, will gratify the student.

Throughout the book the author has tried to maintain a fundamental purpose—correlating all the basic scientific facts, stressing anatomy, physiology and pathology, in a consistent fashion very pleasing to one who teaches neurology

For emphasis excellent illustrations and clinical cases are scattered throughout the book.

It is a well-rounded neurology

Harold R. Merwarth

The Patient and the Weather By William F Petersen, M D with the assistance of Margaret E Milliken, S M Volume IV Part 2, Organic Disease Quarto of 729 pages, illustrated. Ann Arbor, Edwards Brothers, Inc., 1937 Cloth, $11 00

This volume is another in a series which correlate meteorological changes and disease processes In this one, clinical observations on common endrocrine disorders, blood dyscrasias and tuberculosis are presented. One is awed by the tremendous research, the effort and correlation which has gone into it To one who has read the preceding volumes there comes a realization that Petersen is proving his premise, e g —the influence of weather on human beings and their bodily ailments

The subject matter does not lend itself to easy reading, and requires slow, thoughtful digestion Numerous graphs and charts permit a graphic visualization which aid in the understanding of the text. Many beautiful photographs of pathological conditions are included in this volume Once again the format is photo-lithograph from perfect type script This has enabled the publishers to keep down the cost of these volumes

Joseph L Abramson

Practical Proctology By Louis A. Buie, M D Octavo of 512 pages, illustrated Philadelphia, W B Saunders Company, 1937 Cloth, $6 50

This is an excellent book on the subject, fully illustrated, well printed, and carefully written Under chapter one, entitled "The Attitude of the Physician and of the Patient", might well have been included history taking of a proctologic patient and method of charting pathologic findings The subject of constipation warrants an entire chapter devoted to it instead of inclusion under conditions which cause constipation. The same holds true for the various types of abscess, perianal perirectal, and pelvirectal, which are included under anal fistula

However these minor criticisms detract very little from a book on the subject of proctology so competently handled No specialist in the subject will fail to acquaint himself with the contents of this book, and it is highly recommended to any physician or surgeon who treats diseases of the rectum

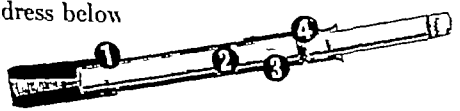
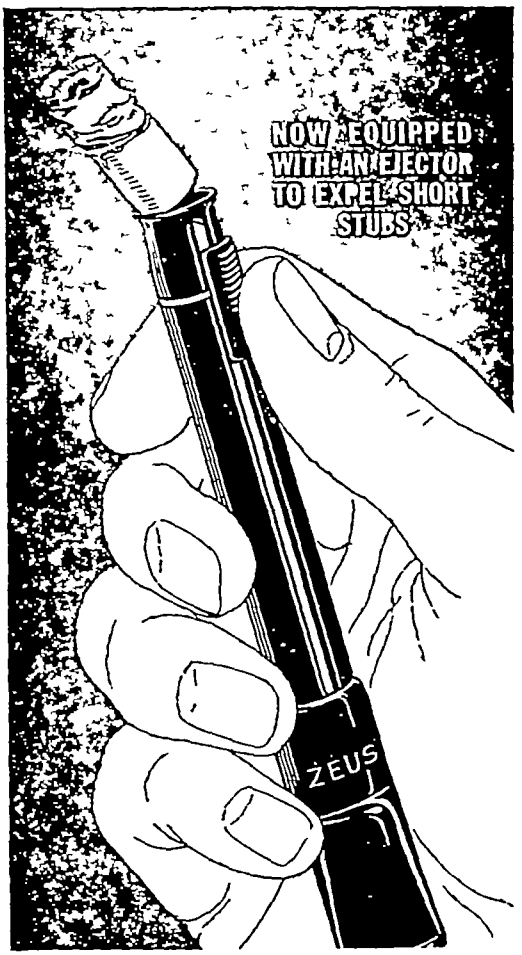
Zeus MAY HELP YOU...WITH PATIENTS STUBBORN ABOUT SMOKING



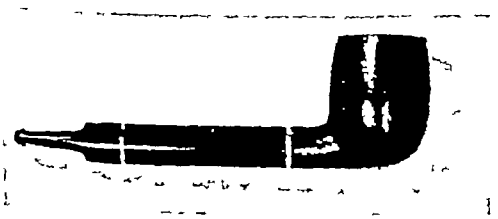
Many Physicians Have Had Marked Success with this Filter-holder Which Eliminates More Than 70% of Nicotine and Tar Products from Tobacco Smoke

THE ADVICE to 'cut down smoking' is often most difficult to follow, even with good intentions of the patient

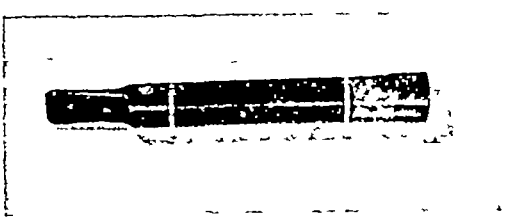


The use of the Zeus Filter-holder permits a 70% reduction in the intake of nicotine and tar products without the user's mental resistance or physical distress (More than a million men and women now use Zeus for smoking pleasure alone)

Many physicians have observed its value in cases of respiratory irritation and other toxic manifestation due to nicotine



Full details about Zeus and the tests conducted by leading scientific institutes, will be gladly mailed you Please write to the address below



Only Zeus is backed by three years official laboratory tests Its high efficiency is due to these exclusive features (1) A perfectly sealed bit no *un*filtered smoke passes through (2) a tube scientifically designed for expansion of filter cigarette in absorbing nicotine and tar products from 30-40 cigarettes, (3) special type aluminum tube condenses vapors in smoke as nothing else can, (4) ejector expels stubs

NOW—PIPES AND CIGAR HOLDERS WITH THE FAMOUS Zeus PRINCIPLE!

• For pipe smokers special Zeus Pipes, several popular styles, with a cigarette as filter, make possible elimination of up to 80% nicotine The Zeus Cigar Holder, of much the same appearance and using the same principle as the cigarette holder, eliminates 70% nicotine and tar products The Zeus Corporation, 745 Fifth Avenue, New York

INSTITUTIONS SPECIALIZING IN TREATMENTS

The Spa—An Aid to Physicians

For a good many years, European Spas have been recommended in a great many cases for their curative and stimulating value to patients fatigued mentally and physically Today, however, we have available in America, spas equal to those in other parts of the world—equal in climatic and balneic conditions, and thoroughly developed to care for patients exactly as their physicians prescribe The advantages of an American spa for your patients are proximity that enables you to maintain close contact and personal supervision, availability of results permitting flexibility of treatment procedure, immediate fulfillment of your prescription, minimum of travel expense, peace-of-mind, impossible in the Europe of today

Conveniently located—an American spa that measures up to all these desired advantages, is the white sulphur springs at Richfield Springs, New York Since 1820, these springs have been useful in treating many constitutional diseases such as rheumatoid arthritis and gout, certain types of heart, kidney and digestive disturbances, and skin diseases like acne, eczema and psoriasis Thoroughly supervised hydrotherapic treatment and diet therapy in accordance with every detail of your prescription, are obtainable in combination with the sulphur water bathing and drinking

In addition there are the local facilities for sports and the absence of faults usually attributed to American spas

ALL THE ADVANTAGES OF A EUROPEAN "CURE"

IN A PEACEFUL AMERICAN VILLAGE

Richfield Springs White Sulphur Baths in Central New York State have complete facilities for hydrotherapy and diet supervision Ideal climate and environment. Convenient for treating functional and constitutional diseases for which trips to foreign spas are usually prescribed. Facilities include Sulphur Nauheim and Pine-needle baths massages of all types Scotch and tonic douches steam electric cabinet, thermal lamps gymnasium. Prescriptions followed exactly Physicians invited. Send for descriptive folder Dr H. V Frink, Medical Director Richfield Springs, N Y

TRAVEL *and* RESORTS

WHERE TO GO • HOW TO GO • WHAT TO DO • WHERE TO STAY • WHERE TO DINE

Here is the Latest Travel News!

Just as the forms are closing for this issue, T R. Gardiner, popular business manager of this JOURNAL, announced he was leaving on a combined honeymoon and well-earned vacation

According to his plans, Mr Gardiner expects to become the first 1938 June bridegroom somewhere in Connecticut, from which point he will leave immediately for an undisclosed destination.

While receiving the congratulations and good wishes of his friends in and out of the Medical Society, before leaving, Mr Gardiner was questioned regarding the rumors of a contemplated change by the New York State Medical Society in the management of their Journal, Directory and Commercial Exhibits of their annual convention

"As to the management itself," said Mr Gardiner, "I know of no changes contemplated by the Society In fact, under the terms of the existing agreements, the present management continues for a number of years

"There were, however, certain financial changes recommended by the Journal Management Committee and Council to the Society which came up for debate at the recent meeting I understand that these were not approved but were referred to a Committee, which probably accounts for the various rumors you have heard"

Mr Gardiner then went on to point out how ridiculous the rumors were, and that he wanted to assure the advertisers, exhibitors and subscribers that with their continued cooperation they could depend on him to do everything in his power to build a bigger and finer Journal, Directory and Annual Exhibit.

℞ *"Sea Air, Sun and Rest"*

How many times would you have prescribed a sea trip—if your patient could still be close at hand for supervision and treatment.

Consider the Half Moon—New York's only hotel on the Atlantic Ocean! Here your patients will have the benefit of fresh sea air, sun bathing on the ocean deck, rest, comfort and change, regular meals of the finest food, tastefully prepared, light exercise on the Boardwalk, relief from the distractions and noises of the city streets

Neptune for the Nerves

WE are frequently told by physicians that for neural disorders the best of all sanatoriums is the sea

And this opinion is confirmed by the increasing number of people sent to Atlantic City for rest and quiet.

Nerves jangled by the jazz of life in town become tranquil again under the sedative influence of salt air and the serenity of sea spaces

Moreover, being a natural health resort, Atlantic City appeals to those who need the solace but object to the discipline of a sanatorium

However, Doctor, you need not worry about either the appetite or the sleep of your patients at Atlantic City

The climate can be depended on to stimulate one and induce the other!

VEGEX
for
B VITAMINS

VEGEX—AUTOLYZED BREWERS' YEAST EXTRACT

B Vitamin Complex—Extrinsic Factor (Anemias)

Composition

Extract from autolyzed, genuine brewery grain grown yeast, condensed in vacuo About three per cent of an extract from fresh vegetables is added, of no known physiological or allergic significance Iron reinforcement is had with ferrous malate—100% available (Elvehjem test) The copper supplement comes from the yeast

The sodium chloride necessary for the autolyzing process dilutes as used—a teaspoonful to a cup of water—to from one-fourth to one-third of one per cent, or about one-half the concentration in the average piece of toast.

Vegex supplies the B vitamins and minerals of brewers yeast in a more readily available form It has a palatable meat-like flavor—meat free—and is found easily borne by infants or in post operative cases

Analysis

	Per Cent		Per Cent
Protein (N x 6 25)	32 6	Calcium as Ca	0 098
Fat	0 8	Iron as Fe	0 058
Calories per ounce	40	Magnesium as Mg	0 13
Sodium Chloride	11 1	Copper	0 00275
Phosphorus as P	2 62	Manganese	Distinct Traces
Potassium as K	2 18		

Starch and sugar free for restricted diets

Biological Tests (Albino rat)

One teaspoonful—about 6 grams in natural combination, no B_1 reinforcement—assays

Sherman Chase B_1	270 units	B Complex (all known B vitamins in an entirely unaided and B complex free diet)	12 to 15 units
International B_1	135 units		
Sherman Bourquin B_2	240 units		

Clinical Tests and Use

Anti beriberi factor — mass use World War by Allied troops

P-P (pellagra preventive) factor—mass use Southern States, Egypt, Italy India and Malay

Extrinsic factor (intrinsic factor noted) Rhoads, Strauss and Castle, Wills Vaughan, Lassen and Lassen, Groen, West, Ungley and others

B complex child growth factor, pioneer use, Pritchard

Other widely accepted need for the B vitamins, such as anorexia, promotion of lactation, reproduction, proper functioning of the digestive tract

CHILD AND MAN UNITS

Accurate child and man units have not been arrived at. Cowgill s Vitamin B requirements of Man are based on [illegible] units as applied to diets c[illegible] e[illegible] min potency,

from vitamin B as the vitamin B complex as well as B_1

For Vegex the child and man units, along with other of the vitamin B complex factors which may be in the diet, are reported from the medical research and from private practitioners substantially as follows

B Vitamin Complex Reinforcement	12– 24 Gms
Infant Feeding	1– 3 Gms
Child Feeding	3– 6 Gms
Expectant or Nursing Mother	20– 25 Gms
Alcoholic Polyneuritis	18– 25 Gms
Macrocytic Anemia other than Pernicious	15– 50 Gms
Pernicious Anemia	50–125 Gms

There are approximately 6 grams of Vegex to a level teaspoonful

Samples and literature for clinical use on request

GENERAL USE

One outstanding observation is the marked way in which Vegex generally aids in strength recovery with the patient and particularly in preparation for and as the liquid diet after an operation

VITA[illegible]

• VEGEX, INCORPORATED

TREET, NEW YORK CITY

Are the Neuritic Symptoms of Pregnancy *due to a deficiency of vitamins B_1 and G?*

SUCH common neuritic symptoms of pregnancy as pains in arms and legs, muscle weakness, and (less frequent but more serious) paralysis of the extremities may result from a shortage of antineuritic vitamins, recent investigations appear to show Although neuronitis of pregnancy has long been considered a toxemia, no toxins have ever been identified

Clinical observations of Strauss and McDonald lead to the conclusion that the condition is a dietary deficiency disorder similar to beriberi, caused by lack of vitamin B_1, complicated by symptoms which may be traced to shortage of vitamin G They report recovery in their cases receiving this therapy, including dried brewers' yeast

Hyperemesis as Cause of Avitaminosis

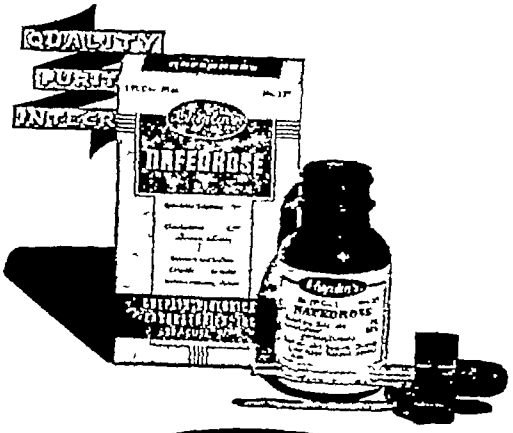
Wechsler observes that all cases of polyneuritis of pregnancy recorded in the literature were preceded by long periods of severe vomiting "It would seem," he adds, 'that because of actual starvation these patients suffered from avitaminosis and consequent neuritis," a view likewise held by Hirst, Lukart, and Gustafson Plass and Mengert observe that the practice of giving high carbohydrate feedings for hyperemesis gravidarum is still more likely to cause avitaminoses B and G

Dried brewers' yeast, as it is far richer than any other food in vitamins B_1 and G, is being used with benefit both in the prevention and treatment of polyneuritic symptoms of pregnancy Lewy found that additions of yeast to the diet reduced electric irritability of the peripheral nerves and brought clinical improvement. Vorhaus states that he and his associates, after administering large amounts of vitamin B_1 to 250 patients having various types of neuritis, including that of pregnancy, observed in about 90% of cases "varying degrees of improvement, i e , from partial relief of pain to complete disappearance of all symptoms '

Need for Vitamins B and G in Lactation

Evans and Burr, Hartwell, Sure and co-workers, and Macy *et al* are among numerous authorities who find that the nursing mother also needs supplements of vitamins B_1 and G, from 3 to 5 times the normal requirement. Tarr and McNeile report that the physical, mental and emotional status of 120 pregnant and lactating women receiving Mead's Brewers Yeast and other foods high in vitamin B was superior to that of a control group of 116 women

Since the management of polyneuritis of pregnancy is difficult at best, it would appear logical to supply those dietary substances which may safeguard against it. One of the richest and most convenient sources of the anti neuritic factors, vitamins B_1 and G is Mead s Brewers Yeast Tablets. Consisting of nonviable yeast, they offer not less than 25 International vitamin B_1 units and 42 Sherman vitamin G units per gram



Supplied in bottles of 250 and 1,000 tablets, also in 6-oz. bottles of powder

Please enclose professional card when requesting samples of Mead Johnson products to cooperate in preventing their reaching unauthorized persons

IMPROVED EPHEDRINE THERAPY

Chaplin's

Nafedrose

An Isotonic Aqueous Solution for Topical Application to Relieve Congestion of the Nasal Mucosa

The value of Ephedrine as a local vaso-constrictor has been widely recognized, but employment of irritating solvents for the drug has greatly handicapped its usefulness

Now, in **Nafedrose,** a combination of dextrose and sodium chloride, in proportions physiologically isotonic, provides the ideal vehicle for Ephedrine salts This vehicle appears to have no effect on ciliary activity, and permits application of the active ingredient without irritation to sensitive tissues Stinging sensations imparted by other Ephedrine preparations is avoided and the normal physiologic medium of the nasal mucosa is unimpaired. In Nafedrose, the efficacy of the product is further enhanced by the presence of chlorbutonal which serves as a bacteriostatic and provides some local anesthetic effect

Supplied—in 1 fl. oz. dropper bottles, 1 or 12 per box.
See your Chaplin catalogue

Accept this Invitation

EVEN without previous experience, YOU can make extremely accurate electrocardiograms with a minimum of manipulation and at small expense with the entirely new light-weight, low-priced G-E Electrocardiograph

You can obtain all of electrocardiography's recognized advantages from this compact, sturdy, dependable instrument—vitally important clinical information to aid materially in diagnosis and prognosis

You can depend upon the new G-E Electrocardiograph to give faithful, economical service in office, home, or hospital It is substantial, light enough to be truly portable, heavy enough to assure durability There are no gadgets or "trick" electrical circuits to complicate operation, instead, there is that all-too-rare combination of precision and simplicity that is the mark of sound engineering and years of experience in careful manufacturing

To inspect and operate the G-E Electrocardiograph is to realize how valuable it would be to you in your daily practice (and, if we may say so, what an excellent investment it would be) Won t you accept a cordial invitation to actually make a cardiogram on it—in your own office—at your convenience—and without incurring any obligation? Detach and mail the convenient coupon—now

A-B-C *of Foot Health in*

PEDI-ATRIC SHOES

Physicians have given their unqualified approval of PEDI-ATRIC SHOES for young growing feet. They know them to be correctly constructed and accurately proportioned to encourage a normal foot development. Further, they know that the vitally important question of *fitting* is given the most scrupulous and unhurried attention by experienced Benjamin fitters

We also carry a complete line of correct shoes for men and women

BUFFERED ALKALINIZATION
by the safe, physiological process

WHERE buffered alkalinization is desirable—as during sulfanilamide administration, in the treatment of colds, influenza and other seasonal respiratory affections—Kalak offers these clinical advantages

(1) It presents a balanced combination of bicarbonates in solution (2) It contains the mineral substances normal to the blood (and no other)

Kalak's high buffering value helps to maintain the urinary pH of 7 4 which has been found so desirable in sulfanilamide therapy

KALAK *is synthetically prepared—is hypertonic, uniform in composition, definite in alkali potency*

WE PROVED IT *at the* CONVENTION!

A few of UNITHERMS outstanding features are:

- tube rectified circuit—including our exclusive "Tube Sentinel" prevents tube blowout.
- 300 Watts output.
- Special Surgery circuit.
- Special Inductance Cable circuit.
- BI-POLAR Surgery Control.
- Oversize Power Transformer—Completely Shielded.
- Oversize Filament Transformer
- Fire-Proof chassis of Cold Rolled Steel.
- Designed for "Permanent Efficiency" Transformer designed to meet all future Tube developments
- NO RADIO INTERFERENCE
- *Custom-Built TAYLOR TUBES*
- *Extra-Large Capacity Tuning Condensers Balanced Circuit.*
- *Dignified, SOLID WALNUT 2 piece cabinet.*

$245. UNTIL July 15th

At the Convention you saw UNITHERM bring into the short wave market compelling new values—You were convinced then that no better short wave could be made at twice UNITHERM S price—You agreed that no short wave made has ever been designed with the forethought and completeness that makes UNITHERM the AGELESS ' Short Wave Most of your colleagues who thrilled at UNITHERM S amazing performance BOUGHT UNITHERM RIGHT on the convention floor—UNITHERM'S CONVENTION PRICE" of $245.00 was to be our presentation price, we are pleased to announce that the brisk buying of your colleagues has made it possible for United Laboratories to keep UNITHERM S price at $245 00 until July 15th YOU HAVE THIRTY MORE DAYS TO PURCHASE UNITHERM at a dramatic saving The coupon will reserve YOUR UNITHERM at this Convention Price and also entitle you to an office demonstration with your full right to revoke your reservation if UNITHERM does not OUT PERFORM short waves twice its price

RESERVE YOUR UNITHERM NOW *at* THIS LOW PRICE FILL IN COUPON *and* MAIL

milk

for certain dermatological conditions

IN many dermatological conditions, calcium medication has proven of therapeutic value. Certain cases of eczema, moist, itching dermatosis and erythema nodosum have responded favorably to calcium medication In itching dermatosis calcium medication has greatly ameliorated the itching . . . in many cases brought complete relief The use of calcium is of particular benefit in the treatment of cutaneous manifestations of sensitivity to various agents, including drugs.

As an aid to calcium medication, milk merits consideration both because of its rich calcium content and also because (as demonstrated by Bergeim) lactose increases the absorption of calcium into the bloodstream Thus it would seem that milk offers a good and practical way to increase the calcium intake, so contributing to the health of the skin *The Bureau of Milk Publicity, Albany*

THE STATE OF NEW YORK

MILK *Must Be Cooled* QUICKLY on Dairylea Farms

THE Dairymen's League requires that every one of its 40,000 farms have proper facilities for cooling milk quickly and keeping it cool

Our dairying experts have shown us that temperature is as important as cleanliness in the proper handling of milk. They have given us the latest methods of keeping milk cool as well as clean And they make frequent unannounced visits to our farms to see that all regulations are followed

We recognize the importance of pure milk products in the diet, and we are proud of our farms as a recognized source of pure milk products

We are confident that for any of your patients on diets, including milk, you will make no mistake in recommending Inspected-Protected Dairylea milk products

Produced by

THE DAIRYMEN'S LEAGUE CO-OPERATIVE ASSOCIATION, INC.

Our Pledge: We, the farmers of the Dairymen's League, recognize a definite obligation to the public. Since milk is nature's most nearly perfect food, we pledge ourselves, in the production of Dairylea Milk Products, to do everything within our power to safeguard their purity and quality

CAMP SUPPORTS KNOW NO SOCIAL REGISTER

This exhibit is now on a nation wide tour in the interest of public health education

ONE of the most significant observations made during public showings of the Camp Transparent Woman is the fact that "Judy O'Grady an' the Colonel's Lady" display the same intense interest in this remarkable exhibit—not to mention the same ignorance about the structure of their own bodies

To date over two million persons have seen the Camp Transparent Woman The medical profession realizes, of course, that just as this interest in the Camp Transparent Woman knows no social register—the *need* for correct scientific support is equally unmindful of social rank The variety of Camp models embraces the same broad scope, for S H Camp & Company sponsor a special garment for every figure requirement

It is important, therefore, to remind d tors that the sensible, low prices of Ca Supports bring them within reach of who need them Constant research close collaboration with medical auth ties help to make Camp Supports the v finest and most effective supports obt able *at any price* Fitters trained by the Ca organization are available in good stores through the country to assure doctors that their presc tions will receive expert attention

Camp Supports are never sold by door-to-door c vassers It is not surprising therefore that m doctors, in prescribing scientific garments, m sure to *specify* Camp Supports

CAMP TRADE MARK *Supports*

Take two slices of Bread...

THESE two slices of bread have a lot in common The same amount of dough, the same baking brought them both into the world But . the one on the right is larger has fewer air pockets, is better tasting

And this difference is no accident. as thousands of bakers could tell you That better slice comes from a loaf made with Borden's powdered milk. The other doesn't

Every day, every Borden milk plant must send a sample of its output of powdered milk to the Borden laboratories And that day s output cannot be shipped to the bakery trade until experts at the Borden research bakeries have wired their approval of the test loaves approval as to volume and color—grain texture. and aroma—and, most important of all, *flavor*

And so although there is no such thing as "a loaf of Borden's Bread" more than a billion loaves of bread a year are *better* loaves because of Borden s powdered milk.

This is part of Borden's purpose. For, whether a product is offered to industry, to the public, or to the medical profession, the quality of *every* product bearing the Borden name is scientifically safeguarded and controlled

RANTOSILK *and* HOLLANDEX
For Home and Hospital Use

● For bed sheets, pillow cases, surgeons' aprons, and surgical garments used in hospitals, take advantage of Rantosilk or Hollandex—the last word in processed surgical fabrics. They are fine silk and lawn calendered with crepe rubber—are light in weight and will outwear much heavier material.

Their ability to withstand creasing, rolling and folding without the slightest harm to the surface commends it for hospital use. They may be washed, boiled, autoclaved, stitched. Will not crack, peel, fade or stick. Resistant to acids, alkalies and heat. The positive impregnation with rubber of each fibre accounts for the superiority of Rantosilk and Hollandex. *Write for literature.*

SPECIAL: A one-reel film on diaphragm-fitting technique—available without cost to medical groups.

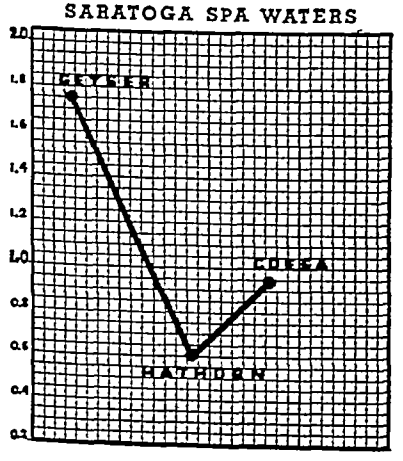
THE NATURAL MINERAL WATERS OF SARATOGA SPA
ARE OWNED AND BOTTLED BY THE STATE OF NEW YORK

In Repairing a Mineral Deficiency



as in pregnancy, for instance, the value of the natural mineral waters of Saratoga Spa makes itself felt with particular emphasis The unique *natural* carbonation makes them palatable and encourages the patient to take the full prescribed amount.

The richness of their mineral content is displayed in the tabular analyses of the three waters, as shown below All are of saline-alkaline type, but variable as to total mineralization and saline-alkaline ratios.

The labile form of the contained minerals encourages their assimilation This is a mineralization impossible of artificial duplication. Ready evidence lies in the fact that, once evaporated out of solution, the salts are not again entirely soluble That is why the State bottles the natural mineral solutions, and seals them under their own natural CO_2 pressure. No air can touch them until the bottle is uncapped.

For professional literature write W S McClellan, M.D., Medical Director Saratoga Spa 155 Saratoga Springs N Y

RATIO OF BICARBONATES/CHLORIDES IN THE SARATOGA SPA WATERS

THE BOTTLED WATERS OF SARATOGA SPA

"GEYSER" "HATHORN" "COESA"

The growth of science is the evolution of a means of overcoming or avoiding limitations, uncertainty and the ambiguities of commonsense judgment.

Or, in the words of Whitehead: "The obvious commonsense notion has been entirely destroyed (by science) so far as concerns its function as the basis for all interpretation One by one, every item has been dethroned "

Our quality pharmaceutical products are guaranteed as to purity and identity in assay of raw materials; accuracy, cleanliness and perfection of production and uniformity and correct dosage of the finished products—all supported by laboratory control records for the protection of the medical profession and their patients

SULFUPRONT

(Strasenburgh)

Solutions of Elementary Sulfur in Water and Alcohol—clear and precipitating . .

Therapeutic effectiveness depends upon the factors of absorption and assimilation These in turn depend upon solubility of the chemical substances used and therefore, for the first time in the history of sulfur therapy, we are offering *genuine* water and alcoholic solutions of elementary sulfur to the medical profession

SULFUPRONT (Strasenburgh) is indicated for Acne (its various stages), Epidermophytosis (Athlete's Foot), Seborrhea, Pityriasis sicca, Rosacea, Mycotic and parasitic eczemas, generally fungus diseases of the skin

SULFUPRONT solutions are stable at room temperatures They contain *sulfur* in such a form that *deep penetration* and, therefore, *greater therapeutic efficacy* are assured

See our exhibit in the display room of the New York State Journal of Medicine

† *Cocomalt the protective food drink* is fortified *with these amounts of Calcium Phosphorus Iron and Vitamin D*

Provides essential food minerals in usable form

Each ounce-serving of Cocomalt is *fortified* with 15 gram of Calcium, 16 gram of Phosphorus Therefore, an 8-oz glass of milk with 1-oz of Cocomalt provides 39 gram of Calcium, 33 gram of Phosphorus And as an aid to the system in utilizing these food-minerals, each ounce of Cocomalt also contains 134 U S P Units of Vitamin D, derived from natural oils and biologically tested for potency

Cocomalt has found favor with many physicians because of its special food aid during lactation and pregnancy Called the *"protective food drink,"* Cocomalt, in addition to its Calcium, Phosphorus, Protein, Carbohydrates and Vitamin D, is also fortified with Iron, lacking in so many natural foods The effective Iron, 5 milligrams in each ounce-serving of Cocomalt, has been biologically tested for assimilation Thus, 3 glasses of Cocomalt and milk supply the normal patient s daily optimum Iron requirement

Either Hot or Cold, the creamy, delicious flavor of Cocomalt appeals to old and young alike Inexpensive, Cocomalt may be obtained in purity-sealed cans at grocery and drug stores in ½-lb , 1-lb and the economical 5-lb hospital size

FREE: TO ALL PHYSICIANS

Cocomalt is the registered trade-mark of R B Davis Co Hoboken N J

For Your Anemia Patients

prescribe

McKESSON'S COPPER-IRON COMPOUND

McKesson's Copper Iron Compound is manufactured under license from the Wisconsin Alumni Research Foundation, Hart Patent No 1,877,237

The increase in hemoglobin and red cell count is noticeable almost immediately, in nutritional and secondary anemias of infants, children and adults, when you prescribe McKESSON'S COPPER-IRON COMPOUND And it is a sustained improvement Many case histories prove this

McKesson's Copper-Iron Compound is an effectively balanced proteid combination of organic salts of copper and iron So, the results are dependable Your patients will assimilate it easily It is non-toxic and non-astringent It does not affect elimination or digestion does not harm the teeth It is palatable So that you may prove these facts for yourself, a professional sample will be sent to you, with an informative booklet you'll be glad to add to your library Just use the coupon below

McKESSON & ROBBINS

INCORPORATED

NEW YORK • BRIDGEPORT • MONTREAL

McKesson & Robbins, Inc , Bridgeport, Connecticut (NY-6)

Please mail me, without charge, a professional sample of McKesson's Copper Iron Compound ☐ Liquid ☐ Tablets, and your descriptive booklet

LIGGETT'S—AMERICA'S WORD FOR DRUG STORE

The Smallest Effective Dose of Iron

ARSENOFERRATOSE

Trade Mark Reg U S Pat Off

Its active constituent BI-FERRATIN provides in the smallest dosage sufficient assimilable iron to produce optimum clinical results.

- **More than 2 times as utilizable for assimilation as FERROUS SULFATE**
- **More than 6 times as utilizable for assimilation as IRON AND AMMONIUM CITRATE**

Comparative metallic equivalents sufficient for optimum hemoglobin regeneration

ARSENOFERRATOSE is easily reduced in the digestive juices into the absorbable ferrous form of iron

ARSENOFERRATOSE is non-styptic, non-corrosive, milk-miscible, and effectively stimulates the appetite

The Leader Among All Prescriptions of Ferruginous Tonics

Indicated in

HYPOCHROMIC ANEMIA

Supply: Arsenoferratose, bottles of 8 fl ozs, bottles of 75 tablets, Arsenoferratose with Copper, bottles of 8 fl ozs

CARCINOMA AND ADENOMA OF THE RECTUM

ROBERT C PAGE, M D, *Tuckahoe*
Fellow in Pathology, The Mayo Foundation, Rochester, Minnesota

The coexistence of carcinoma and adenomas of the rectum gives rise to much speculation as to the relationship between these two neoplasms Does carcinoma of the rectum arise from essentially normal mucous membrane or is it the result of a malignant change in a pre-existing adenoma? Adenomatosis (multiple polyposis) of the colon has a familial tendency and is known to undergo malignant metamorphosis in fifty per cent of cases [1] The carcinoma probably arises in one of the multitude of adenomas that stud the colon and in an adenomatous colon it is not infrequent to find two or more carcinomas in different stages of development.

Dukes[2] made a detailed study of the intestines in 127 cases in which the patients had died of some condition other than carcinoma of the large intestine He found adenomas in twelve (9 4%) of these cases He found six adenomas in one case, four in one case, two in one case, and one in each of the remaining nine cases In twenty-five of thirty-three cases (79%) in which intestinal resection was performed for carcinoma of the rectum or sigmoid colon, he found adenomas in the portion of intestine which was removed

In eight (4 7%) cases of carcinoma of the rectum and sigmoid colon, Yeomans[3] found associated adenomas He suggested that carcinoma of the colon is frequently mediated through an adenoma but at the present time it cannot be affirmed that all carcinomas of the rectum and sigmoid colon originate from adenomas

Stewart[4] said that in twenty-one of seventy-nine cases of carcinoma of the colon (26 6%) necropsy revealed associated polyps

Many pathologists and surgeons believe that adenomas (polyps), especially those situated in the lower part of the gastrointestinal tract, are particularly prone to undergo malignant change, however, proof of this has been very difficult to obtain Martin[5] said that adenomas are either the principal agents or are predisposing factors in cases of carcinoma of the rectum Wide excision of the carcinomatous intestine was advised by David[6] so that potentially malignant polyps in the vicinity of the carcinoma, also may be removed. Schmieden[7] said that cancer of the intestine develops from polyps, which are precancerous lesions and undergo malignant degeneration as a result of external irritation.

Lockhart-Mummery and Dukes[8] said that the sequence of events preceding carcinoma is believed to be hyperplasia, adenoma (precancerous state), then cancer They studied the mucous membrane of the large intestine in the region of a carcinoma and found multiple areas of epithelial hyperplasia, most of which were only visible under the microscope They also found adenomas which were visible with the naked eye They interpreted these areas of hyperplasia as the initial event in the development of carcinoma. The next step is a crop of sessile adenomas scattered over a large area of mucous membrane. Then, after a long or

TABLE I—RELATION BETWEEN GRADE OF CARCINOMA AND PRESENCE OF ADENOMA

Grade of carcinoma	Cases	Sessile adenomas		Pedunculate adenomas		Cases in which both sessile and pedunculate adenomas were present		Cases in which no adenoma was found	
		Number	%	Number	%	Number	%	Number	%
I	6	5	83	0		0		1	17
II	62	35	57	7	11	16	26	4	6
III	21	11	52	5	24	0		5	24
IV	11	2	18	1	9	1	9	7	64
Total	100	53		13		17		17	

TABLE II—METASTASES IN REGIONAL LYMPH NODES IN CARCINOMA OF RECTUM

Grade of Carcinoma	Cases	Carcinoma found in regional lymph nodes		Carcinoma not found in regional lymph nodes	
		Cases	%	Cases	%
I	6	1	17	5	83
II	62	24	38	38	62
III	21	16	76	5	24
IV	11	6	55	5	45
Total	100	47		53	

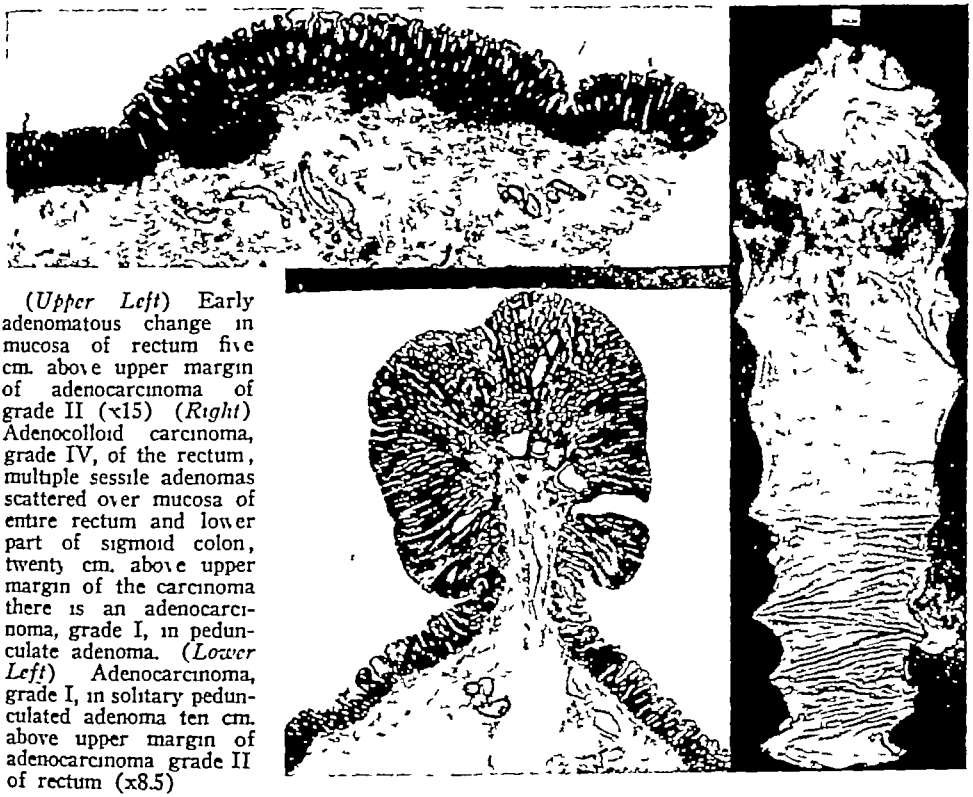
short interval, a carcinoma begins in one of the adenomas or in the neighboring epithelium and the remaining areas of hyperplasia and the adenomas regress so that the mucous membrane about a carcinoma at the time of resection may contain only a few benign lesions

Cattell[9] observed the transition of polyps into malignancy and advised that every polyp of the rectum, irrespective of size or benignancy, should be fulgurized

Solitary adenomas of the rectum and lower portion of the sigmoid colon were found by sigmoidoscopic examination in one hundred and forty-three cases at the Mayo Clinic between 1920 and 1928 Brust[10] in analyzing these cases found that in eighty-seven, the adenomas were not treated and at the second examination, at intervals of two to ten years from the first examination, in three instances the untreated adenoma apparently had increased in size In one case there was no change in size or appearance of the adenoma after three years Four untreated patients were examined and found to have carcinoma superimposed on the site of the previously noted adenoma

Dukes, in comparing experimental tar cancer to cancer of the rectum, said that they both pass through comparable stages Under the influence of some carcinogenic agent the epithelial cells of the mucous membrane of an extensive portion of the intestine are stimulated to more vigorous growth in separated areas Later, a crop of adenomas arises from this sensitive field and some of these become surrounded by secondary tumors The mucous membrane in the clefts between the primary and secondary tumors becomes folded inward and the dislocated cells may be the first to undergo malignant change

Method of Study



The specimens studied were carcinomas of the rectum and rectosigmoid which were removed at the clinic in the years 1936 and 1937 The resected rectum was examined in the fresh condition shortly after operation in most cases while the remaining specimens were fixed with formalin The mucous membrane of the entire specimen was examined with the naked eye and areas suggestive of adenoma were examined under the low-power dissecting objective Blocks were cut from the carcinoma in the fresh state so that the type and grade of the tumor could be determined A careful examination of the lymph nodes in the specimen was made to ascertain if metastasis had occurred

Results of Study

In all, one hundred cases of carcinoma of the rectum and rectosigmoid were studied In ninety-three, the tumor was an adenocarcinoma, in six it was a colloid adenocarcinoma, and in one a melanoepithelioma was found In eighty-three cases sessile adenomas, pedunculated adenomas or both were found (Table I), and in only seventeen was the mucous membrane in the region of the carcinoma free from adenomas

Metastatic lesions were present in the lymph nodes of the perirectal tissue in forty-seven cases (Table II) The highest incidence of metastasis occurred in cases in which the carcinomas were grade III (76%) and grade IV (55%)

The distance from the mucocutaneous junction of the anus to the lower border of the neoplasm was found to be 2 6 cm in cases in which the carcinoma was grade I 5 3 cm in cases in which it was grade II, five cm in cases in which it was grade

(*Upper Left*) Early adenomatous change in mucosa of rectum five cm. above upper margin of adenocarcinoma of grade II (x15) (*Right*) Adenocolloid carcinoma, grade IV, of the rectum, multiple sessile adenomas scattered over mucosa of entire rectum and lower part of sigmoid colon, twenty cm. above upper margin of the carcinoma there is an adenocarcinoma, grade I, in pedunculate adenoma. (*Lower Left*) Adenocarcinoma, grade I, in solitary pedunculated adenoma ten cm. above upper margin of adenocarcinoma grade II of rectum (x8.5)

III, and 4.3 cm in cases in which it was grade IV

The sessile adenomas were found much more frequently (53%) in association with carcinoma than were the pedunculated adenomas (13%) This lends support to the statement of Brust that, "it has been frequently stated that the sessile type of adenoma is more prone to malignant change than the pedunculated type"

The highest percentage (94%) of adenomas was found in conjunction with grade II carcinomas, while the lowest percentage (36%) was found with grade IV carcinomas

Comment

The association of adenoma with carcinoma of the rectum in eighty-seven per cent of the cases studied is significant This figure is so much higher than that for the occurrence of adenomas in a large series of normal intestines (9.4 per cent) that it cannot be regarded as an incidental or unrelated finding

The higher percentage of adenomas associated with carcinoma of the lower grades suggests that the carcinoma has developed in an adenoma while other adenomas have been arising and growing There is usually a longer period of time between the inception of malignancy and time of operation in the low grade carcinomas (I and II) than in the higher grades (III and IV) of carcinoma. This longer interval allows the carcinogenic factor a greater period of time in which to exert its force on the area of low resistance (rectum) and causes the precancerous condition to appear In this case it is the adenoma which must be regarded as the precursor of the carcinoma

If the carcinoma is allowed to continue its growth, other adenomas may become malignant and multiple carcinomas may be found in the rectum It is very common to find low grade adenocarcinoma in an adenoma of the rectum (See above illustrations)

In the case of the more highly malignant carcinomas, that are growing rapidly, it is reasonable to postulate that the original adenomas have been destroyed

by the advancing malignancy and that of the rectum have been examined for time has not been adequate for the the presence of adenoma In eighty-growth of additional adenomas three, adenomas were found associated All adenomas of the rectum should be with carcinoma of the rectum There is considered potentially malignant and a definite relationship between adenoma should be removed as soon as they are and carcinoma of the rectum Adenomas diagnosed of the rectum should be regarded as potentially malignant and, for the safety of the patient, should be removed as soon as they are diagnosed

Summary

One hundred specimens of carcinoma

AN UNUSUAL COMPLICATION OF LABOR

CAPTAIN FRANK A MINAS, M C and 1ST LIEUT DAVID J GRAUBARD, M D,
Med-Res, U S Army Station Hospital, Fort Jay, N Y (DJG)
New York City

De Lee mentions that "as a result of overpowerful bearing-down pains and efforts the woman may fracture her sternum " We wish to present a case of fracture of the xiphoid process of the sternum occurring during the second stage of labor in a multipara with a previous normal history

A hasty review of the mechanical forces producing an increase in abdominal pressure which is so vital to the second stage of labor leads us to the following conclusion That during an expulsive pain there is a powerful bearing-down effort which is produced by the downward excursion of the diaphragm and contractions of the recti, the obliqui, and the muscles of the flanks The above mentioned muscles are attached to the xiphoid process of the sternum as follows on the posterior surface to the diaphragm, and on its lateral borders to the aponeurosis of the abdominal muscles The xiphoid being thin and elongated and more or less ossified can be bent or twisted by the contractions of the named muscles However, we must remember that it also articulates with the body of the sternum and that any similar force may also cause a dislocation or a dislocation-fracture

Case Report

M R., age thirty, wife of an officer, nativity U S, was admitted to the Station Hospital, Fort Jay, N Y, April 4, 1935 Previous medical and surgical history was irrelevant *Obstetrical history* Normal delivery of a normal male child in 1929 Patient claimed she had "pyelitis" during the last gestation Her last menstrual period was July 8, 1934, and the estimated date of delivery was April 14

Her chief complaints on admission were Restlessness, difficulty in getting about, swelling of the ankles, and moderate increase in blood pressure Physical examination was essentially negative although the blood pressure was 154/94 X-ray examination verified a twin pregnancy, both fetuses showing cephalic presentation without locking *Urinalysis* One plus albumin with innumerable leukocytes microscopically *Blood count* Hgb—sixty per cent, RBC—3,870,000, WBC—13,500, Polymorphonuclears eighty-three per cent. Wassermann and Kahn reactions were negative. *Blood Chemistry* NPN—twenty-eight Mg per cent, Glucose—eighty-six Mg per cent, Urea N—14 Mg per cent, Creatinine—1 3 Mg per cent, Calcium—11.2 Mg per cent, Phosphorus—5.2 Mg per cent The temperature was normal, pulse eighty-four, respirations eighteen The patient desired to leave the hospital after two days and

was discharged *Diagnosis on discharge* Pregnancy, twin, near term, not in labor

On April 15, the patient was readmitted to the hospital although she was not in labor Her general physical condition was the same as at her previous admission It was thought advisable to start labor, since the time of the estimated date of term had been reached and at 12 30 P M, April 17, the membranes were ruptured artificially Soon thereafter the patient began to have pains which became severe enough to warrant taking her to the delivery room at 7 00 P M The pains continued with satisfactory progress At about 2 30 A M (April 18) the pains suddenly ceased The patient complained of pain in the epigastrium and tenderness at the tip of the sternum Examination revealed no abnormalities in the mother or fetuses The patient made no progress and it was deemed best to resort to operative procedures At 9 15 A M a midforceps was applied and a male child delivered Fifteen minutes later, a version and extraction was done in the delivery of a second male child

Soon after delivery, and after the patient was conscious, she complained of a small protruding mass in her epigastrium Examination revealed the xiphoid process to be disarticulated ventrally from the sternum No treatment except the application of a tight binder and ice-bag was given The relaxation of the abdominal muscles and pressure helped reduce the fracture. The patient made an uneventful recovery and was discharged April 28

The patient was seen several months later and had no complaints referable to the epigastrium or sternum and the xiphoid protrusion which was evident at delivery was firmly fixed in its normal position.

Discussion

Dislocation of one of the normal segments of the sternum from another is a rare injury and one not always to be distinguished clinically from fracture In an extensive review of the literature [1-4] we were unable to find any single specific report of a fracture, dislocation or fracture-dislocation of the xiphoid process due to the muscular stress of the abdominal muscles during parturition, although several texts have mentioned the possibility of the phenomena. It is in view of the rarity of this condition that this article is being presented

It is not new to us that the abdominal muscles play an important part in the expulsion of the child even though the role played may be only one of the secondary forces We know that the exciting causes of fracture are three-fold (1) Direct violence, (2) Indirect violence, (3) Muscular action Of the latter it is said that the most frequent cause of fracture of small bones or of osseous processes into which powerful muscles are inserted is the tremendous pull of muscles An example of this force is the fracture of the patella following attempts to prevent or ease a fall, or the olecranon process of the ulna

Fracture of any part of the sternum is rare and may be incomplete, multiple, transverse, longitudinal or oblique Fracture of the body is most common in the upper half, those of the xiphoid, including its separation from the body are extremely rare Its displacement may be forward or backward The treatment consists in reduction by direct pressure, aided if there is overriding by extension of the trunk and by deep inspiration by the patient, and in retention by a broad band of adhesive plaster around the chest

The diagnosis in this case is, clinically, beyond a doubt, fracture, simple, complete transverse of the xiphoid process of the sternum with anterior displacement We were unable to demonstrate it with the x-ray

Summary

1 Fracture of the sternum may occur in parturition when the strain is excessive and distension increased as in multiple pregnancies

2 Cessation of active labor pains may be one of the results of fracture of the sternum, necessitating operative interference for a healthy mother and viable offspring

(DJG) 574 West End Ave.

THE CINDERELLA OF MEDICINE

KARL A MENNINGER, M D, *Topeka, Kansas*

The title I have selected may have led you to expect a fairy tale I shall begin what I am to say, however, with a special version of one of Aesop's fables

Six blind men sat by the gate of a great city as an elephant was led slowly past Inspired by scientific curiosity of the highest degree, the six blind men rushed forward to palpate the great beast and to determine the nature of his being

The first man's hands fell upon the elephant's tusks "Ah," said he, "This creature is a thing of bones, they even protrude through his skin" Later on, years having past, this man became an orthopedist

At the same time the second blind man seized the elephant's trunk and identified its function "What a nose!" he exclaimed "Surely this is the most important part of the animal Accordingly he became a rhinologist.

The third man chanced upon the elephant's great flapping ear and came to a similar conclusion, for him the ear was everything, so he, in time, became an otologist

The fourth blind man rested his hands on the huge chest and abdomen of the elephant "The contents of this barrel must be enormous," he thought, "and the pathological derangements infinite in number and variety" Nothing would do but that he should become an internist

One of the blind men caught hold of the elephant's tail "This," he said, "would appear to be a useless appendage It might even be a source of trouble Better take it off" This blind man became a surgeon

But the last of the six men did not depend upon the sense of touch Instead he only listened He had heard the elephant approaching, the rattle of chains and the shouts of the keepers It may be that he heard the elephant heaving a great sigh as he trudged along "Where is the creature going?" he asked No one answered "Where did he come from?" he asked No one knew

Then this man fell into a deep reverie What was in the elephant's mind, he wondered, in having left wherever he was and having come to this great city Why does he submit to the indignities of our curiosity and the slavery of chains? And while he was wondering how to find out the answers to these questions the elephant was gone

This man became a psychiatrist

The other blind men were disgusted at this impracticality They turned their backs upon their visionary companion What difference does it make, said they, what the elephant's purposes may be? And his chains—they constitute a legal not a medical problem The important thing is to recognize the animal's structure!

Then they fell to quarreling among themselves as to whether the elephant's structure was primarily that of a nose or that of an ear or that of a tail And although they all differed flatly from one another on these points they all agreed that the psychiatrist was a fool

It would be pleasant for me to assume that this allegory no longer represents accurately the attitude of the specialties of medicine toward one another and toward psychiatry In some respects I think that the proper continuation of the allegory would represent the six blind men taking counsel with one another and making some concessions that the elephant had ears as well as a nose and that he had purposes and feelings as well as tusks and a tail The tendency in all scientific research is to lose one's perspective in the intensity of one's special interest Psychiatrists may do this no less than surgeons or otologists

But in the main it is true that physicians have forgotten or ignored or repudiated the psychological factors in their patients Modern medicine is based upon three basic sciences—physics, chemistry, and psychology Of these chemistry is the oldest For many centuries it completely dominated medicine The

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, May 10, 1938

physics of the body were considered unimportant and physical methods of treatment were considered unethical, undignified, unscientific It was only in very recent times, relatively speaking, that some members of the barber guild became surgeons, that bonesetters became orthopedists and that stone crushers became urologists It was only in recent times that the mysticism and magic that permeated the recipes of the pharmacopoeia were purged by the cold light of pharmacological science But it has been still more recent that psychological data have assumed some recognized validity of their own and ceased to be a vague compilation of theories, variously derived from philosophy, religion, and superstition A systematic physics of the body was arrived at before a systematic chemistry, but both became the common property of physicians long before a systematic psychology was known to anyone.

It cannot be said that psychology has been incorporated into medicine as yet, either in theory or in practice In practice, medical science has long since become so great in its scope and complex and in its detail as to favor the development of three kinds of physicians those depending chiefly upon physical concepts especially in their treatment methods—and here I have in mind the surgeons—those depending chiefly on chemical measures—and here I have in mind the internists—and those depending on psychological methods—and here I have in mind the psychiatrists What a physician should be called who utilizes all three of these basic sciences in his work I do not know, unless it would be that we come back to a new and prouder use of the simple word "physician" In that case what I am extolling are not psychiatrists but that kind of a physician, one for whom physical chemical, and psychological data have equal validity

As a general thing, however, I am afraid this does not prevail Patients are much more apt to get good physical and laboratory examinations than to get good psychological examinations, or good psychological treatment I have previously made the statement that if a psychiatrist were to make a diagnosis of appendicitis on the basis of a psychological examination alone he would be justly criticized, yet many doctors are quite willing to make a diagnosis of psychoneurosis on the basis of a physical examination alone.

Suppose I should ask you—and you are representative, progressive physicians—did you in examining that patient yesterday make any psychological examination? Did you, for example, ask him anything about his dreams? No? Why not? Are they not a part of him, a product of his anatomy and physiology and psychology? Meaningless? Negligible? Compare the reactions of a practitioner of medicine fifty years ago when a youngster, recently from medical school, proposed that he examine his patient's urine "What? Urine? I *did* examine it—it was dark and stank What more is to be examined? Urine is of no importance—it's only an excretion, to be thrown out quickly" And can you imagine the old fellow's scorn when his son diffidently asserted that it was considered by some doctors to be really possible to examine urine with a flame, with chemicals, and with a *microscope*—*for* the purpose of understanding better the organs and the human being from which it came?

And is it really so very different from the proposal that dreams, too, can be analyzed—if one studies the technics?

I am reminded of course that there are practical reasons why surgeons, dermatologists, and others feel justified in omitting some of the technic of a complete personality inventory "Psychiatrists," they say, "are overwhelmed with too many data They can't use all they have We don't have time to get so much information about the patient A patient might die while we are getting it Furthermore it is unnecessary for the determination of the best practical treatment in many cases"

I won't deny the fact that short-cut methods of examination are desirable What I deny is that one has any right to make this short-cut method at the total expense of the psychological factor If a man breaks his leg, it is perfectly true that he doesn't want his surgeon to spend three or four hours getting a family or social history or making an intelligence test or analyzing dreams before he puts the leg in a splint On the

other hand, a complete omission of the psychological factor might lead, and I think often does lead, to serious errors in the treatment Such an investigation in this case, for example, might prove that the man had broken his leg while in a fit of rage, trying to kick his dog or his child or that his insurance policies paid him $500 a month disability, or that this was the fourth time that he had fallen in this particular spot and the second time he had sustained a fracture in such a fall, suggesting that there was something more than mere chance involved In other words, a broken leg is a piece of local destruction and may be a covert form of self-destruction One can confine himself to merely repairing the destruction as a carpenter repairs a broken joist and wait for the next piece of self-destruction or the next accident or the next infection—or one can look at it in the broad sense and compare this with other self-destructive events in the life of the individual and relate them to some more fundamental patterns

All this sounds so logical—at least *I* think it sounds logical—that the question ought to be, why is not psychiatry the queen of the medical specialties—in a sense the mother of them all, the integrating and synthetic phase of medicine itself? Or at least why is it not better integrated with the rest of medicine? To some extent, as my brother Will has said, the psychiatrist himself is responsible for this For many years he contented himself with his assigned but very limited task of looking after an esoteric group of individuals in a secluded cloister on the periphery of a village He spoke infrequently and then chiefly about such imponderables as dementia precox and depersonalization, sometimes about dairy barns He seemed closer to his patients than to the profession and the rest of life

Thus for years psychiatry remained, as I have indicated in the title, the Cinderella of medicine She sat alone by the fire in the kitchen, while her proud sisters Ophthalmology and Pediatrics strutted in the parlor Sister Surgery was there, too, forgetful of her humble origin in the barber-shop, and Mother Obstetrics was never reminded of her poor relations, the Midwives

When, by the Fairy Godmother's aid, the transformed Cinderella appeared at the Great Ball (the war), she outshone all her sisters It was there she won the Prince's favor (popular esteem), and thereafter she came out of the kitchen and consorted with her fashionable and now deferential sisters, and at last married the Prince It was Thomas Salmon, of New York, who first used this figure, a man whose broad vision, whose keen mind, and whose winning personality did much to favor the ascendancy of this Cinderella And while it is true that the laity has assimilated the principles of psychiatry more rapidly than have some parts of the medical profession, I do not think it was the public alone whose good graces put psychiatry where it is today I think the intelligent, honest realization of an important portion of the medical profession itself that the psychological factor in medicine could no longer be ignored, forms our most dependable support Some have felt, not without justice, that psychiatry has been oversold, this is true if one means that a greater need for it exists than our present supply of psychiatrists can fill

For it was inevitable that science should have gradually displaced the ancient superstitions and taboos attaching to the medical man whereby it was inconceivable for him to be imperfect So long as the medical man could not bear to examine his own psychology he could not logically concede it to have any importance among the clinical data of his patients Among the discoveries of Freud, perhaps the greatest are those pertaining to the scientific study of the emotional bonds which develop between the patient and the physician So long as it was taboo for the doctor to ask himself, "Why am I a physician? Why am I interested in disease? Why does the specialty of pediatrics appeal so to me?" and similar questions, it was necessary also to avoid, "Why did the patient expose himself to syphilis? When did the gastric ulcer patient begin to hate his wife? What is the purpose of this woman's illness?"

For are not the wishes the dreams and desires, the fears, and hates and envies of a patient as much a product of his being as his urine, his blood, his spinal fluid?

Are they not as deserving of analysis and as amenable to treatment measures?

What I have been saying may have carried some of you beyond your convictions or my persuasions, so I shall pursue that line of thinking no further, because it is not necessary to explain why psychiatry, the Cinderella, left the kitchen and married the prince The fact is that she has done so If you doubt this, reflect upon the fact that in several medical schools more time is devoted today to the teaching of psychiatry than to the teaching of surgery, that more hospital beds are filled with psychiatric patients today than are filled with all the medical and surgical and tuberculous and orthopedic and all other cases combined That the state of New York spends many thousand times as much upon the care of psychiatric cases as upon the care or prevention of medical and surgical diseases of all other types And if you reply that this is because of the social importance of psychiatry I should reply that all disease has social importance and that the failure as physicians to recognize this has laid us open to criticism and to error I do not mean by this to indicate my approval of the state care of the ill It does not have my approval I only mean to remind you that the state has for a long time been in the business of caring for some of the ill and that this some is a much larger number than many of you realize As a psychiatrist in private practice, I can get no satisfaction out of the fact that the state is my largest competitor and that although we are friends, we are not cooperators And I strongly feel that had we physicians recognized from the first that *psychological and social factors are a part of medical science* that we could have made a better arrangement for the care of the mentally ill than now exists and better arrangements for other illnesses that now threaten Those of you who fear that state medicine will compete with private initiative in other forms of illness might take this as a warning I must tell you in frankness that some physicians whom I have heard loudly declaiming against state medicine, sometimes do everything possible to prevent a patient from receiving the psychiatric care he needs and resort in the end to sending him to a state hospital without any inkling of the inconsistency of this program It is this very inconsistency—this blindness to the psychological and social aspects of the human being, a blindness of which a few of our colleagues seem even to be proud —which is one reason for the rise of state medicine

I am sorry to have injected this serious note into the hour of relaxation afforded by this banquet after the heavy program of the day You see, I have had some theories about the instinct toward self-destruction, the way in which man fights against himself I have extended it from clinical phenomena such as martyrdom and suicide to social phenomena such as crime and even to nations warring against nations, and against themselves Our profession, too, sometimes betrays this human trait of fighting against itself As a psychiatrist my daily occupation is the recognition of such tendencies and the outlining of programs for their circumvention or redirection You must forgive me if I cannot resist the application of my professional technics to the problems of my own—our own—profession

I do not know what the future of psychiatry will be I would certainly not leave you with the impression that we psychiatrists have so great a lack of modesty as to assume to guide the development of all medicine We have no monopoly on the comprehensive study of the human being, unless by neglect you force it upon us From the indications of your courtesy in having invited me here to speak for my fellow psychiatrists and having listened so graciously to my strictures and suggestions, I have the impression that you have no wish to do so On behalf of Cinderella, ladies and gentlemen, my appreciation and my compliments!

THE MENNINGER CLINIC

More than 4 000,000 pounds of aspirin were used in the United States last year, which only goes to show the size of the national headache—*Troy (N Y) Record*

TRIGGER FINGER

CLIFTON W HENSON, M D, *New York City*
Assistant Attending Surgeon, Broad Street Hospital

The condition known as trigger finger, locking of a finger upon semiflexion, necessitating unusual force to accomplish extension, which occurs with a snap, is often an irritating problem to the surgeon on account of its persistence in spite of treatment The minor nature of the disturbance often causes refusal of open operation, and dissection of the finger, and the operation is not always successful when allowed

Abbe[1] described a method of operative treatment based upon the principle that the pathology consisted of constricting fibrous bands, stretched across the flexor tendon at the metacarpophalangeal joint He stated that a case was cured by inserting a bistoury through the skin on the anterior surface of this joint, and making longitudinal incisions in the tissue and tendon beneath, moving the knife and skin together, thereby separating transverse adhesions, through a puncture wound He stated that the cure occurred immediately

The following case is reported to illustrate the usefulness of the procedure recommended by Abbe even if a cure is not immediately accomplished

Case Report

Patient's left hand was pressed between an elevator door and a hand truck, which was being pulled through the door Pain was immediately experienced over the anterior surface of the left ring finger This pain continued for one week, and then disappeared There were no further symptoms until three weeks later, when the man awoke to find his finger semiflexed, extension being accomplished only by the use of force, and accompanied by a snap The typical symptoms of trigger finger continued

Examination Slight tenderness was present over the proximal interphalangeal joint of the left ring finger The joint locked upon flexion, extension occurring suddenly with a snap upon the application of force Diagnosis was trigger finger

Treatment A splint was applied holding the finger in extension for a period of two weeks No improvement followed Vigorous massage was then undertaken for a period of two weeks, with no benefit.

Due to the negative results following conservative treatment the patient consented to an operation after the method of Abbe, stating that under no circumstances would he allow open operation upon the finger Although it appeared that the pathology was located in the vicinity of the proximal interphalangeal joint, judging by the location of the tenderness and the snapping sensation, the bistoury was first introduced in the manner described by Abbe over the metacarpophalangeal joint, and deep longitudinal incisions were made in the tendon and tissues beneath, moving the bistoury and skin together No relief occurred and therefore the same procedure was attempted upon the proximal interphalangeal joint. As no relief of symptoms resulted, it seemed that transverse, constricting adhesions were probably not responsible This condition may be due to other causes such as nodular enlargement of the tendon or displacement of a sesamoid bone or joint cartilage.

It was therefore thought that sufficient scarification upon the anterior surface of the joint causing subsequent fibrosis and adherence of the anterior margins, might prevent any change in relationship of the articular surfaces upon flexion The anterior surface of this joint was therefore thoroughly scarified, and although upon flexion the locking still occurred, the finger was fixed in extension by means of an anterior splint.

Upon removal of this splint at the end of two weeks, no locking occurred upon flexion The motion was limited approximately twenty-five per cent and slight thickening was present over the anterior surface of the joint. Baking and massage was advised, but the patient appeared for only two treatments

Course Examination of the patient three months later revealed slight thickening on the anterior surface of the proximal interphalangeal joint and ten per cent limitation in flexion of this joint. The patient, however, experienced no pain and stated that the slight stiffness in no way affected the usefulness of the finger

FIBROMA OF THE OVARY

JOHN F CURRAN, M D, F A C S, RAYMOND H GOODALE, M D, and EDWARD T CRANE, M D, *Worcester, Mass*

From the East Surgical Service, City Hospital (Worcester) and Surgical Service, Holden District Hospital, Holden, Mass

Of the benign tumors originating from the stroma of the ovary, the fibroma is perhaps the most important The prognosis with operative intervention is excellent The following cases illustrate the symptom complex associated with this type of tumor

CASE 1 L O, age twenty-six, white housewife, was admitted complaining of pain and enlargement of the abdomen About one year ago she began to feel the abdomen enlarge, but was not aware of a mass until six months ago She lost eleven pounds by dieting, but her abdomen remained the same size. It grew much larger during the two weeks previous to admission and during this time she experienced pain in the right side especially toward the back She then had difficulty in breathing, was nauseated, and vomited foamy fluid once just before admission

Bowels and bladder were normal (negative) She has always had dysmenorrhea

Physical examination showed the abdomen rounded, especially the lower third A hard, freely movable, round mass was present extending from the pubis to just below the ensiform There was some bulging of both flanks The right upper quadrant was tender

Vaginal examination revealed a laceration of the cervix on each side Both vaults were tender The above mentioned mass was palpated and seemed free from the uterus

Operation Laparotomy was done under gas-oxygen and ether anesthesia A hard tumor was found occupying the greater part of the abdominal cavity, attached to the left tube and apparently arising from the left ovary There was considerable free serous fluid in the abdomen The tumor, tube, and appendix were removed

Pathological report Specimen consists of a round firm tumor apparently growing out of the ovary It weighs 4 6 kilograms (10¼ lbs) and measures 25×20×20 cm On section it is pale blue and has streaks of yellow The upper pole is cystic and degenerated.

Microscopic description The section shows a spider-web arrangement of hyalinized connective tissue in most fields There are no mitoses

Diagnosis Fibroma of ovary

CASE 2 E H, age fifty, white housewife, was admitted complaining of slight vaginal bleeding for two months, and a mass in the abdomen for the past six years Her menopause took place eight years before admission She had nocturia two to four times for two years

Physical examination showed a large, irregular, hard mass filling almost the entire lower abdomen Pelvic examination revealed a marital introitus and a small amount of fresh blood oozing from the vagina and cervix. The uterus seemed slightly enlarged and displaced to the left On palpating the right vault, the mass described above moved

Operation A laparotomy was done under gas-oxygen and ether anesthesia A large firm tumor was found originating from the left ovary by a double pedicle

Pathological report Specimen consists of a firm, white roughly oval, lobulated mass measuring 20×12 5×13 cm It has a blue-grey cystic structure on the surface measuring 4×3 5×3 5 cm On section the center is hollow and contains necrotic material and blood clot The distance from the surface to the central hollow area varies from 2 to 5 5 cm and is composed of homogeneous, firm white tissue

Microscopic description Section shows short interlacing spindle cells in large numbers forming a solid field There are no mitoses

Diagnosis Fibroma of the ovary

Discussion

Both of these patients had an uneventful convalescence and were discharged without symptoms

Meigs[1] discussed twenty-nine cases of fibroma of the ovary and mentioned the following significant facts

The ages ranged from 20 to 79 years Twenty-six were married and twenty-one had children Eight patients had normal and regular periods before the onset of the present illness The menstruation of four

RAYMOND S ROSEDALE

IN Y State J M

Summary

Two cases of fibroma of the ovary are discussed A resumé of their symptoms indicates that such patients are aware of a mass in the lower abdomen, and have moderate pain over the same region One patient in addition had abnormal vaginal bleeding and nocturia The other patient has dysmenorrhea and vomited once Operative removal of the fibroma dispelled the symptoms in each case

CITY HOSPITAL.

was profuse, and of four, painful Twenty-two complained of pain, which was low abdominal Ten complained of urinary symptoms, pelvic examination showed a pelvic mass in eighteen Four tumors were infarcted and necrotic

The microscopic picture of ovarian fibromas suggests that they arise from the stroma However, they have been described as arising from the corpus luteum, tunica albuginea, organized blood clots, corpus fibrosa, and the walls of blood vessels None of these possibilities seems as likely a source as the stroma

HYPODERMIC NEEDLE IN STOMACH WALL

RAYMOND S ROSEDALE, M D, *Buffalo*

From the Department of Pathology, Buffalo City Hospital and the University of Buffalo Medical School

Cases of needles being recovered in situations quite remote from their alleged portals of entry have been reported many times However, in reviewing the literature of the last eighteen years concerning such cases, no report of a hypodermic needle in the stomach wall was found Lane[1] recovered a "cambric" needle, found in the posterior wall of the stomach near the greater curvature, by gastrotomy

A hypodermic needle in the posterior wall of the stomach was found in a recent postmortem examination at the Buffalo City Hospital The patient had died of cardiac decompensation He had given a history of having been treated for syphilis ten years previously There was no laparotomy scars, nor evidences of repeated hypodermic injections over the surface of the body

At autopsy the needle was discovered by a sense of induration conveyed in palpating the area where the needle was lodged, there being no visible signs suspicious of such a condition On dissection the immediately surrounding tissues were brownish-tinged The needle was firmly imbedded in the tissues but on removal was found to be frail and easily broken It measured 2 3 cm in length, and was estimated to be about an #18 gage, the surface was faintly irregular with rust The lumen and also a taper point were still recognizable

Sections of the site of embedment revealed a typical foreign body inflammatory reaction consisting of multinucleated giant cells, lymphocytes, connective tissue, and histocytes, some of which contained iron pigment

A premarriage clinic has been opened in Sydney, where health tests are available for couples about to marry, reports the *AMA Journal* The clinic is subsidized by the state government of New South Wales and is sponsored by the Racial Hygiene Association It arranges an exhaustive overhaul by any of twelve specialists for a nominal fee It issues certificates that (1) the parties contemplating marriage are fit to marry and raise a family, (2) the marriage should be delayed for from three to six months or (3) the marriage should be permitted without parentage or should be discouraged The clinic receives 100 letters a month on marriage problems

HEMOLYTIC STREPTOCOCCIC MENINGITIS

Recovery in a Case

BENJAMIN SCHWARTZ, M D , LL B , *New York City*

Consultant Physician Gouverneur Hospital, Department of Hospitals, New York City, Attending Physician Broad Street Hospital, Consultant Physician Manhattan General Hospital, Visiting Physician Peoples Hospital

Before the use of sulfanilamide, meningitis due to the hemolytic streptococcus had a case fatality of at least ninety-five per cent During the past few months, however, recoveries in this disease following the use of sulfanilamide have been reported fairly frequently

This case is being reported on account of the general interest in the subject

Case Report

S.L , age forty-three, female, married, was seen in consultation on February 28, 1937 She had been ill for about three weeks with an upper respiratory infection On February 24 it had become necessary to do a paracentesis on the right ear This was followed by free drainage of pus which cleared up within a week. At that time (February 28), she was suffering from headache and vomiting and had a temperature of 104° F As there was slight stiffness of the neck, a diagnosis of meningitis was made and she was admitted to the Manhattan General Hospital A lumbar puncture was done and cloudy fluid obtained under great pressure. Antimeningococcic serum was given intraspinally, awaiting the bacteriological report. No organisms were found in the fluid until March 1, when gram positive cocci in chains appeared in the smear The growth on culture media yielded a hemolytic streptococcus

On March 1, the patient was given ten c.c. of prontosil intramuscularly every four hours and 7½ gr of prontylin by mouth every six hours At this time the patient presented all the typical signs of meningitis and was in a deep coma Antistreptococcic serum was also given intraspinally The blood count showed 21,300 white blood cells with seventy-four per cent polymorphonuclears and ten per cent stab forms

After receiving the prontosil and prontylin for about three days, the patient came out of her coma and seemed clinically very much improved, although she still had a rigid neck, was running a fever between 100–102° F and had a positive culture of the hemolytic streptococcus in the spinal fluid On March 6, the dose of prontosil was cut to five c.c. every four hours and the dose of prontylin was increased to ten gr The spinal fluid remained positive for organisms until March 11 Occasional punctures were done until March 22, at which time the spinal fluid was clear—showed only sixty five cells per cubic mm , most of which were mononuclears, a slight increase in the protein and a normal sugar The smear and culture were, of course, negative The temperature reached normal on March 9 Prontosil was discontinued on March 11, but the use of the prontylin was still continued.

On March 14 the temperature began to rise again with the onset of serum sickness This was attended by urticaria and pains in the joints On March 19, the temperature rose to 104° F The patient became jaundiced vomited and was very listless

It is impossible to say whether this was the effect of the serum sickness or a toxic effect from the continued use of the prontylin In any event, since the spinal fluid had long since been sterile and all signs of meningitis had disappeared the prontylin was discontinued The temperature became normal again on March 22 and the patient was discharged six days later in excellent condition

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B LIBER, M D, DR P H, *New York City*

Editorial Note *Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine*

Look, Listen!

The first business of the doctor is to *observe*, to stop, to look, and to listen—impartially, to search for the truth wherever it will lead him, not to make up his mind before he has gathered his facts, to inspect, to view before he touches or palpates In mental hygiene he must make the greatest effort to be *neutral*, to let the patient speak—what he says, how he says it is the chief part of the examination—or to put his questions in such a way that they can be answered in the affirmative or in the negative or that they may call forth a narrative *Leading questions are misleading* and deceiving, they are signs of impatience and betray a layman's lack of training

Two physicians, an old and a young one, were interviewing a male patient whose complaints seemed to be somatic He claimed to suffer from fatigue and from a feeling in the eyes as if he needed "to rub" them There were "stabbing" pains in the legs and feet, on the sides and in the arm pits, headaches after four or five hours of sleep, "sitting up chases the headaches away," difficulty in breathing, heart palpitation

The young doctor, a postgraduate student, thought there must be some organic cause to those troubles and he was assigned the duty to examine the patient, which he did as thoroughly as possible The result was negative But he had neglected the first indication contained in the patient's speech—*the facial expression* that failed to confirm the complaints His "fatigue," his "stabbing pains," his "palpitation," his "headache" were mentioned with many details, but *indifferently*, unconvincingly, not to speak of the *incoherence* of these symptoms Evident *exaggerations* abounded!

At the second session the patient, apparently unsatisfied with the impression he had made, produced a paper with many notes—some of them repetitious Two bones on the head were swollen and sensitive to touch, "knife-like" pains in the heart, heart "fluttering in the chest," pressure "on the brain," "losing consciousness of a sudden" and feeling sick to vomit, dizziness and sleepiness, pains "in both lungs," switch-like" pains in arms and legs, "shooting" pains in the head (again the head), pains in the eyes (repetition) when touched, and pains "back of the head" (a variety of his headache?), "the scalp of the head is drawn" (another form of sensation in the head?) After several questions he said "I like to live, but I am afraid of worse pains at some future time I feel, therefore, that suicide would be a good thing" And then he went over some of his previously mentioned symptoms and pointed to his arms and legs "In here, it is as if a dead nerve, as if a drop of cold water were constantly present"

About his stomach he said it was all right but sometimes "when he had gas it was coming even from his ears" Was he drinking? No, he would not put "his finger" into a glass of whiskey "for ten thousand dollars"

Patient was asked about his past life, about his family, about his sex intercourse He was not interested, answered quickly and superficially, except when speaking of sex "Sometimes I have an urge to overindulge Is it wrong? But I am not doing it"

When questioned about his habits and about reading he replied that he was sober and that he read nothing "But when you used to read it was only newspapers, was it not?" "True—one paper, always the same" The young doctor had an interrogative glance The patient's sophisticated English, his stilted journalese language revealed his brand of culture

Then came the most delicate of all the questions It went into the patient's relationship with each member of his family during childhood and with his present household That he evinced no concern for the health and welfare of his wife and child, for that of his parents and siblings, was not surprising *This is characteristic for that type of mental condition* But there was an exception regarding his youngest sister and when emphasis was laid on his former friendship for her, the postgraduate student again seemed perplexed However, there was nothing extraordinary in this discovery The incestuous tendency was evident to anyone who had not missed the patient's features at the mention of this sibling Then came the corroboration in

the form of a long confession, which proved actual incestuous activity in the past Indeed, this behavior of long ago of our patient, with his deep regret and feeling of guilt, was the pivot on which the entire illness hinged This secret in his life took, in this case, the form of a *neuropsychosis with manic-depressive trends* Happily, it was not very advanced and did not interfere with the patient's occupation

This was a good example of the great importance of scrutiny and observation.

It reminded me of the story told about the medical teacher who, while speaking before his class about diabetes mellitus and the ancient method of tasting the urine with the tongue, put his finger into the specimen and showed how Then he called out a student and encouraged him to do the same thing But when the poor boy, after imitating the master, was nauseated, the angry admonition came "Why don't you learn to observe? This will be a good lesson for you! Didn't you see that I put in one finger into the urine and licked another finger?"

But a well-known Viennese proctologist who was a very careful and exact observer regarding his narrow field, happened to be absent-minded about the general appearance and the physiognomy of his patients—which would be particularly bad from the point of view of the mental student. (And which progressive doctor is not or should not be a mental student?) One day in his crowded waiting room, each time the doctor emerged from his consulting room, a man stood up and wanted to be examined The answer was "It is not your next Sit down!" But when this patient was finally admitted into the sanctum and had undressed, without being permitted to utter a single word, the doctor, facing the postoperative hemorrhoidal scar, recognized his exalted client immediately and, bowing deeply, he exclaimed *"Ich habe die Ehre, Herr Graf! Ich habe die Ehre, Herr Graf!"*

To return to our case, conversations which helped the patient to reject sinfulness and persuaded him that his conduct in his youth must not necessarily bring mental or physical illness, were immensely beneficial Then the frank and repeated analysis of each one of his complaints tore them to shreds He was not completely cured but the few unpleasant feelings that remained, were weak and harmless A real mental disease had been *averted*

NEW YORK COUNTIES AND CITIES WIN AWARDS IN NATION WIDE HEALTH CONTESTS

Two counties and seven cities of New York State have received awards in the 1937 rural and city health conservation contests conducted by the United States Chamber of Commerce in cooperation with the American Public Health Association, reports *Health News* (Albany)

Columbia county won first award and Cortland county an award of merit among the competing rural health units in the Northeastern Division of the United States while Yonkers, Auburn, Elmira, Watertown and Middletown received awards of merit among cities throughout the country in their respective population groups Schenectady and Syracuse, both of which had previously won first awards and were therefore barred from the regular contest, received special awards for having maintained during 1937 their high standards in health protective services

In announcing the awards, the Association made it clear that the prizes are not for the healthiest communities but for the most effective efforts to meet local health problems Awards are not based on health department programs alone but rather on the community-wide efforts of all agencies and groups including the work of private practitioners of medicine and dentistry

'ASK YOUR DOCTOR" ALL RIGHT, TELL THEM

Tired of the blatant ballyhoo over the radio, a New York physician, Dr N Thomas Saxl, writes to the *New York Medical Week*

Why not fight fire with fire? When one listens to the daily radio programs one cannot but be impressed by the fact that a goodly percentage are sponsored by proprietary medical products The constant repetition of 'Physicians prescribe' or "Doctors advise" or "Ask your doctor" is bound ultimately to impress the laity with the veracity of such statements

Would it not be possible for the proper committee of the New York County Medical Society to note these for a period of time and then reply through the medical information bureau in one of our own medical broadcasts that these products do not have the sanction of organized medicine?

EDITORIALS

In Appreciation

In the bustle and rush of the transaction of current business at our recent meeting of the House of Delegates, an announcement of Dr David J Kalıskı, Director of the State's Committee on Workmen's Compensation went almost unheralded and unnoticed Nor does the simple statement that the Honorable Elmer F Andrews, Industrial Commissioner, *had promulgated the metropolitan fee schedule to apply to the entire state,* tell the story of a long and tedious fight, the many clashes and conflicts with industrial organizations, who—through the efforts of their central organization, known as the Compensation Insurance Rating Board—endeavored to secure a fee schedule which reduced the rates from ten to twenty per cent of that paid for the same work in the metropolitan area [See page 942, Section 8]

For once it became possible, although it was by no means an easy task, to create unanimity of opinion among the various county societies Here the obstacle to be overcome was the influence exerted by physicians who heretofore had been doing a large amount of industrial work and also other doctors who felt that they were particularly entitled to even higher fees than prevailed in the metropolitan area

For once the entire profession was united, and eventually even those not actively recognized as in organized medicine, all fell in line

No particular purpose is accomplished in going into the details of the controversy The desired objective, whose achievement was sought, was not so much the adoption of the metropolitan fee schedule which would put an additional sum of money into the pockets of the profession in this state—although this too is not altogether to be forgotten —but it was an earnest endeavor on the part of organized medicine to attract to this work a better type of medical man to undertake industrial surgery and thus bring better medical care to injured workmen and help to restore them sooner to gainful occupation—rather than continue them in the hands of less skillful and perhaps "cheaper" medical men In accomplishing this, a great medical step forward was made It eventually will put added dollars into the pockets of these working men, and in the long run it will save the insurance carriers money

During all the time that the controversy was raging, there was little awareness on the part of the general organized profession of the fighting Dr Kalıskı and his committee quetly but efficiently carried the burden nor shall praise be withheld from his colleagues—Dr Frederic E Elliott and Dr Joseph C O'Gorman We are told that there was no

better lieutenant to Kaliski's captaincy than the devoted Dr Frederic E Elliott

It is a truism which every school-boy learns, that republics are proverbially ungrateful and forgetful of public services rendered, and our democratically organized profession is no exception to this rule We therefore desire to make record of this fine contribution toward better health and public welfare As a profession we stand greatly indebted to these men The public, too, is equally indebted to them They have written a page in medical history in its public relations which is an outstanding refutation of many of the quasi-charges thoughtlessly levelled at the profession Additionally they have demonstrated that when the question of evolving ideas and schemes for delivering a high type of medical care is placed squarely before the medical profession, it will prove true to its age-long traditions—and having the men and the experts—it will develop a method, or a manner of meeting the situation at issue, with the public welfare as its first consideration, and its own economics as a subservient concern

---

Certification of Experts

Organized medicine's role in the administration of the Workmen's Compensation Act in this state is endorsed by the Court of Appeals' decision in the case of *Szold* vs *Outlet Embroidery Supply Company* This decision upholds the right of the Legislature to limit the treatment of compensation cases to physicians certified by their county medical societies No practitioner not on the approved panels may collect from insurers for services rendered for injuries falling within the purview of the Compensation Law

The recent refusal of the United States Supreme Court to review this case places the seal of finality upon the Court of Appeals' decision It also paves the way for adoption of a similar principle to improve the quality of expert medical testimony in the courts

Incompetent, biased testimony, particularly on the issue of insanity and in actions for personal injuries, impedes justice and is a source of embarrassment to all upright physicians and lawyers In the past year a Special Committee on Medical Jurisprudence of the Bar of the City of New York has been cooperating with organized medicine to devise a plan whereby expert medical testimony may be confined to physicians possessing the requisite qualifications

The success of the medical panel for workmen's compensation suggests a similar method to solve the problem of expert testimony As the report of the Bar Association's Special Committee on Medical Jurisprudence recommends, a panel of medical experts could be "created by the several Appellate Divisions of the State on the basis of lists certified by duly accredited examining boards representative of the medical societies of the various counties and of the state "

The panels created by organized medicine for workmen's compensation and medical home relief have worked out very well They are democratic and just and maintain the required standards of service There is no reason why this system should not prove effective in the limitation of expert testimony in the courts to genuine experts

---

A Bad Precedent

There is before Congress a bill which would give osteopaths almost the same status as physicians in the treatment of federal employees under the United States Employees' Compensation Act If the Drew bill, which has been favorably reported by the House Judiciary Committee, is passed, it will break down an important barrier between medical practice and the sectarian healing cults

The Committee on Judiciary of the House of Representatives recommends

that osteopathic treatment under the Drew Act be limited in each state to services permitted by state laws In addition, only osteopaths designated by the United States Employees' Compensation Commission would enjoy the privileges conferred

In spite of these limitations, the Drew Act should be defeated Osteopaths are not qualified to practice medicine If they were, they would receive the medical and not the osteopathic degree The whole system of osteopathy is based on a fallacious theory which ignores major factors in the causation of disease Diagnosis and treatment are accordingly defective

Osteopathy has a limited value in certain conditions Osteopathic training has improved greatly in many states in the past two decades However, osteopathy is still no substitute for medicine and the osteopaths are not qualified to take over the physician's functions It would be dangerous in the extreme to grant osteopaths the right to diagnose and treat disease on a parity with medical practitioners

Besides its threat to the health of federal employees, enactment of the Drew Act would set a dangerous precedent If osteopaths were recognized by the federal compensation laws, it would not be long before chiropractors, naturopaths, and a host of others clamored for similar privileges

Write your Congressman to nip this dangerous movement in the bud by defeating the Drew Act

---

Toxic Effect of Sodium Bicarbonate

With but few exceptions, there is no drug more universally employed by the laity, and the profession as well, than sodium bicarbonate It occupies a prominent place in every medicine chest, and can always be found in the pantry under its alias "baking soda" Its apparent innocuousness has lulled all fear of overdosage Consequently the report of Latchford[1] which details the menaces of sodium bicarbonate comes as somewhat of a shock

According to this observer, cases of tetany have been known to follow the indiscriminate use of this drug While it may be difficult to comprehend the dangers of such a simple substance, it has been demonstrated that, like carbon monoxide, it impedes the normal liberation of oxygen by the circulating blood This is due to its pleionectic action on hemoglobin In pleionexy, less oxygen is liberated to the tissues because the affinity between the hemoglobin and the oxygen is increased over the normal status of mesonexy The body tissues therefore fail to receive a sufficient quantity of oxygen for their normal metabolism and, due to this, a functional disability ensues This may or may not be a permanent one, depending upon the degree of anoxemia

Clinically, severe gastric distress, the very symptom for which sodium bicarbonate is taken, may be increased Cardiac dysfunction and tetany also may be observed These symptoms are the result of the shifting of the dissociation curve of hemoglobin to the left and a decrease of oxygen supply to the tissues In view of the clinical findings of Latchford, supported by the experimental studies of Barcroft, the pharmocology of sodium bicarbonate merits additional attention The gentlest of dogs sometimes do bite

---

Air-Conditioned Operating Rooms

Air conditioning is destined to play an increasingly important role in the treatment of the sick The ability to maintain a constant optimum temperature at all times should materially aid in the enhancement of convalescence and in the reduction of the untoward effects due to the daily, or even hourly, variations of thermometric readings Nevertheless, the enthusiasm which is now

1 Latchford, J K. *Canad Med Ass Jour* 38 356 1938

manifest for this new physical aid has brought about certain harmful situations

Particularly is this true for the air-conditioning of operating rooms which have not been built for the accommodation of such a system Many institutions which have installed such a system in their operating rooms have done this with two purposes in mind They have endeavored to render the patient less subject to the dangers of secondary pulmonary infections which are most frequently noted during the hot summer months and also to ease the operator in his work during this period These objectives have not been achieved in many instances The sudden change in temperature from the air-conditioned operating floor to the ward which is not air-conditioned is much more apt to produce a sudden lowering of the skin temperature and so be followed by a pneumonia The surgeons themselves often complain of this difference in temperature, and several have been known to suffer from severe upper respiratory disorders following an operative schedule

It would be advisable, therefore, when contemplating the installation of an air-conditioning system in a hospital already built to equip the entire institution rather than certain of what are commonly considered the most important or most used parts In the construction of a new building, of course, this question does not present itself In the reconditioning of an infirmary already erected, the air-conditioning engineer must be thoroughly cognizant of the demands which both the sick and the people who care for them require Such an understanding must be realized by both the engineer and the hospital administrators if the ultimate benefits of air-conditioning are to be realized in the field of curative medicine

CURRENT COMMENT

"THE ARTIST CAN WITHIN CERTAIN limits make what he likes of his life In other callings, in medicine for instance or the law, you are free to choose whether you will adopt them or not, but having chosen, you are free no longer You are bound by the rules of your profession, a standard of conduct is imposed upon you The pattern is predetermined It is only the artist, and maybe the criminal, who can make his own "—From "The Summing Up" by W Somerset Maugham

"SINCE 1847 OVER THREE THOUSAND surveys have been made by a variety of organizations looking into the practice of medicine and the distribution of medical care Soon there will be indicated a survey of surveys It is about time to declare a closed season on surveys that are becoming a popular pastime and in some instances something worse. "—Comment in the May issue of *California and Western Medicine*

"YOU'RE BURNED UP OVER a piece of impending legislation You tell somebody you're going to send your protest to your Congressman Your listener happens to be a pooh-pooher of the citizenry's power to influence legislation, a charter member of the 'our-hands-are-tied' school of political do-nothings

"'Save your time,' he'll answer you 'If you have to exercise your democratic perogative, sign a petition What's the difference? They all go into the same wastebasket anyhow'

"But Gerald P Nye, Senator from Nebraska, and Arthur Capper, Senator from Kansas have put the Indian sign on such fatalistic nonsense

'Says Senator Nye 'Let no one discount the influence of the intelligent letter which is written the representative by his constituent

"Says Senator Capper 'Twelve letters carry more weight than a hundred signatures on a petition'

"Put those in your fatalistic friend's pipe —and let him smoke them"—Good advice from *Medical Economics*, May 1938

"WE ONCE HEARD PROF T V Smith of the University of Chicago, make a speech in defense of politicians It was an effective speech, and considerably influenced our attitude toward professional politics The professional politician is, in a way, a sort of professional whipping boy, as well as a professional worrier He undertakes a sort of mass job of worrying for all of

that osteopathic treatment under the Drew Act be limited in each state to services permitted by state laws In addition, only osteopaths designated by the United States Employees' Compensation Commission would enjoy the privileges conferred

In spite of these limitations, the Drew Act should be defeated Osteopaths are not qualified to practice medicine If they were, they would receive the medical and not the osteopathic degree The whole system of osteopathy is based on a fallacious theory which ignores major factors in the causation of disease Diagnosis and treatment are accordingly defective

Osteopathy has a limited value in certain conditions Osteopathic training has improved greatly in many states in the past two decades However, osteopathy is still no substitute for medicine and the osteopaths are not qualified to take over the physician's functions It would be dangerous in the extreme to grant osteopaths the right to diagnose and treat disease on a parity with medical practitioners

Besides its threat to the health of federal employees, enactment of the Drew Act would set a dangerous precedent If osteopaths were recognized by the federal compensation laws, it would not be long before chiropractors, naturopaths, and a host of others clamored for similar privileges

Write your Congressman to nip this dangerous movement in the bud by defeating the Drew Act

---

Toxic Effect of Sodium Bicarbonate

With but few exceptions, there is no drug more universally employed by the laity, and the profession as well, than sodium bicarbonate It occupies a prominent place in every medicine chest, and can always be found in the pantry under its alias "baking soda" Its apparent innocuousness has lulled all fear of overdosage Consequently the report of Latchford[1] which details the menaces of sodium bicarbonate comes as somewhat of a shock

According to this observer, cases of tetany have been known to follow the indiscriminate use of this drug While it may be difficult to comprehend the dangers of such a simple substance, it has been demonstrated that, like carbon monoxide, it impedes the normal liberation of oxygen by the circulating blood This is due to its pleionectic action on hemoglobin In pleionexy, less oxygen is liberated to the tissues because the affinity between the hemoglobin and the oxygen is increased over the normal status of mesonexy The body tissues therefore fail to receive a sufficient quantity of oxygen for their normal metab olism and, due to this, a functional disability ensues This may or may not be a permanent one, depending upon the degree of anoxemia

Clinically, severe gastric distress, the very symptom for which sodium bicarbonate is taken, may be increased Cardiac dysfunction and tetany also may be observed These symptoms are the result of the shifting of the dissociation curve of hemoglobin to the left and a decrease of oxygen supply to the tissues In view of the clinical findings of Latchford, supported by the experimental studies of Barcroft, the pharmocology of sodium bicarbonate merits additional attention The gentlest of dogs sometimes do bite

---

Air-Conditioned Operating Rooms

Air conditioning is destined to play an increasingly important role in the treatment of the sick The ability to maintain a constant optimum temperature at all times should materially aid in the enhancement of convalescence and in the reduction of the untoward effects due to the daily, or even hourly, variations of thermometric readings Nevertheless, the enthusiasm which is now

1 Latchford J K. *Canad Med Ass Jour* 38 356 1938

very costly course of treatment. Two other targets were recommended for shotgun diagnosis with cogent argument. Miss Jean Downes points to the high incidence discovered in adults of relief families through a WPA project of case-finding and adds that seventy per cent of the cases discovered were in the minimal stage of the disease. Dr Leonard Greenburg reminds us that certain diseases, particularly those involving exposure to silica dust provide tuberculosis hazards far beyond those of the general population He warns that in order to secure the cooperation of the industrialist we must assure him that we shall help him to solve the social problem which inevitably results from the diagnosis of an active case of tuberculosis

Dr Marion Loew, Assistant Director of the Division of Maternity, Infancy and Child Hygiene of the State Health Department, drew attention to a group which has not yet been systematically surveyed so that the cost of finding cases cannot at present be ascertained but, at whatever cost, it is a group that deserves consideration Since pregnancy and especially parturition are known to add to the risks of latent tuberculosis, activating the quiescent case and breaking down the resistance of cases that might otherwise never become active, there is certainly a strong argument for making routinely chest films at some stage of pregnancy A study is to be made to determine the practicability of this procedure in the antepartum clinics of the State Health Department. The exact month at which it is most desirable to make the routine examination has yet to be determined Tentatively Dr Loew suggests the fifth month of pregnancy as being the latest month to which such a test can safely be postponed if the patient is to benefit from the recognition of her condition It may, also, be advisable routinely to photograph the chest at some stage after parturition since signs of activity may only appear as a result of the strain of labor

If we accept these indications for a procedure which seems to derogate the nicer forms of clinical judgment which we have been taught to admire, this does not mean that the art of medicine has lost its value. Special technics may be convenient for exposing pathological states but sick people—people afflicted with an infinite variety of fears and responsibilities, and endowed with an equal variety of resources in courage and common-sense—will provide plenty of opportunity for the practice of the art of medicine for our generation at least.

THE WOMAN'S AUXILIARY

To the Medical Society of the State of New York

THREE HUNDRED GUESTS ATTENDED the Supper Dance of the Woman's Auxiliary to the Medical Society of the County of Queens at the Arrow Brook Country Club on the Evening of May 21 The dance was given in honor of Mrs Daniel Swan of Flushing, the newly elected President of the Woman's Auxiliary to the Medical Society of the State of New York

The committee was headed by Mrs Henry C Eichacker Assisting her were Mrs W J Godfrey *Treasurer*, Mrs J M Dobbins *Tickets* Mrs W J Lavelle, *Reception*, Mrs A Braunstein, *Seating*, Mrs M J Schultz *Decorations*, Mrs T M d'Angelo, *Arrangements*, and Mrs F G Riley, *Publicity*

The members of the Queens Auxiliary presented Mrs Swan with a traveling clock as a token of their esteem

---

THE HOPE HORMONE

Our increasing coronary disease, at earlier and earlier age levels, is just one of the many seeming proofs that a Frankenstein is at the heels of civilization We are paying a heavy price for it As war, taxes, road traffic, the competitive struggle and coronary disease strike us down in depression, bankruptcy, panic and collapse, will not our system itself tend to break down?

No! Replies the *Medical Times*

What then, keeps the wheels crazily turning?

The hope hormone. The gods will continue sardonically to see to it that this most miraculous of all hormones continues to be produced in sufficient amounts by the endocrines of the soul and that the world will go on in a fashion no matter how lunatic the trend.

us, and when mistakes are made, takes a whipping for his troubles

"Consider for a moment the so-called medical politician There are very few professional ones But it is not uncommon to hear certain of our professional confreres rather disparagingly referred to as 'medical politicians' Who are they? For the most part they are the men who carry the brunt of the burden for medical organization They are the ones who attend to the business, right or wrong, of keeping Medicine organized They sit in the councils, in policy making commissions, they contact legislators, from township trustees to U S Senators in an effort to influence legislation in behalf of Medicine. They are 'that clique which run things'

"Now this is not being written with any feeling of bitterness It is all very true The politicians do try to run things They have to do so The crux is, how to impersonalize such leadership In democratic organizations the politician tries, or should try, to execute the wishes of his constituents, not all, perhaps, but seeking a compromise program that is acceptable to most.

For the sake of expedience the constituency elects representatives, but the fact that it has done so does not absolve it from further responsibility If it does not know its own mind, if it is unwilling to submit for compromise important, divergent issues, the politician, who must act, can not be blamed for exercising his personal judgment. On the contrary if the chosen representatives refuse to carry out a compromised and acceptable program, they should be replaced by others who will do so "—A sound discourse "On Politicians" from the *Bulletin* of the Toledo Academy of Medicine of recent date

Public Health News

Case Seeking

J Rosslyn Earp, L R C P, Dr P H
New York State Department of Health

At the annual meeting, May 24–26, of the State Charities Aid Association, Dr Robert E Plunkett received special commendation for his slogan "Early tuberculosis must be seen (by the x-ray) since it cannot be heard (by the ear)" Mr Homer Folks' eulogy of this doctrine, coming after the symposium upon "means, procedures, results, and approximate costs of searching for tuberculosis" filled me with somewhat glowing reflections I began to wonder whether the art of medicine in which I had been cradled, is now an anachronism. I saw visions of "contacts" being passed before the x-rays like punch cards through a sorting machine and a suitable proportion of "active reinfection type cases" mechanically deposited into the hopper On returning to Albany I received some comfort from the Division of Tuberculosis Inspection, palpation, percussion, and auscultation are still in vogue, they tell me. A careful anamnesis, they say, is still of value. In the state clinics, at least, clinical judgment is the supreme court of appeal And still, as I understand it, the x-ray examination is of primary importance in seeking to discover early cases of tuberculosis

If we are to diagnose by shotgun methods, then it is profitable to discharge our shot where the ducks are flying most thickly together In the past, children in the grade schools have been very commonly subjected to this method of attack, but it is now proved that the congregation in the grade schools, while tempting to the hunter, is very unprofitable hunting Ninety-nine per cent of the cases of clinically significant tuberculosis found in the state clinics in 1936–37 were more than fifteen years of age although thirty per cent of the persons examined were under fifteen years of age. A much more profitable group for the hunter consists of the adult contacts of open cases of tuberculosis, even though these must be artificially congregated The highest proportion of active cases will be found in the later adult age groups The highest proportion among active cases of those in the minimal stage of the disease is found in the late adolescent and early adult groups In actual diagnosis it costs less per diagnosed case to examine the older adults and this, as Dr Herbert R. Edwards points out, is the cheapest way of removing contagious cases from a susceptible population On the other hand, as Dr J Burns Amberson demostrates, although it may cost somewhat more to discover the minimal cases among young adults, such discoveries eventually save expense in the

SPEAKER KOPETZKY These Reference Committees will find places for themselves, after the matters referred to them by this House of Delegates have been assigned, on the first balcony As you enter those little cubicles, you will find a sign specifying your Committee. There is where you will hold session, and members of the House of Delegates having business with Reference Committees can consult with them there.

SECRETARY IRVING Leo F Schiff, of Clinton, appointed on New Business B sent in a telegram that he would not be here. I believe Dr Anton S Schneider would be ready to serve in his place.

SPEAKER KOPETZKY We will substitute the name of Dr Anton S Schneider, of Clinton, for the name of Dr Schiff on New Business B

Assignments

SECRETARY IRVING There are four supplementary reports, all of which have been placed in type, either stenographic or as a reprint from the JOURNAL. The first three typed ones have been distributed to every member of the House of Delegates by mail within the last week or so, and the printed report, which is supplementary to the report from the Committee on Matters Pertaining to Medical Care, an appendix as it were, is on the tables before the members in reprint form from the May 1 issue of the JOURNAL.

DR. WALTER W MOTT, *Westchester* I would like to request permission to incorporate this supplementary report as an integral part of the Committee's Report on Matters Pertaining to Medical Care.

SPEAKER KOPETZKY They have been received and will be assigned. This year under the new set-up it was necessary for the Speaker, so that we can expeditiously handle matters, to take these reports and subdivide them rather than send them to one committee to handle the whole matter because the Council's report covers a multitude of topics, each of which comes in a special field, and each of which should be reported on by a committee that makes it its special study Therefore, the Speaker is referring these as follows, and if you will take your Annual Reports, you can check them

HOUSE OF DELEGATES

MINUTES OF THE ANNUAL MEETING

May 9 and 10, 1938

The 132nd Annual Meeting of the House of Delegates of the Medical Society of the State of New York was held at the Waldorf-Astoria Hotel, New York, N Y, on Monday, May 9, 1938, at 10 00 A M

Dr Samuel J Kopetzky, Speaker, Dr James M Flynn, Vice-Speaker, Dr Peter Irving, Secretary, Dr Edward C Podvin, Assistant Secretary

1 Report of the Reference Committee on Credentials

SPEAKER KOPETZKY I recognize Peter Irving, Chairman of the Reference Committee on Credentials

SECRETARY IRVING Mr Speaker, there are no disputed delegations, and all those seated are entitled to vote.

SPEAKER KOPETZKY I declare the 132nd Session of the House of Delegates open for the transaction of business

2 Roll call

The Secretary called the roll by counties and stated "There is a quorum present"

3 Approval of the Minutes of the 1937 Session

SECRETARY IRVING I move that the reading of the minutes of the last meeting be dispensed with and that the minutes be accepted as printed in the *July 1, 1937* and *August 15, 1937* issues of the JOURNAL, with one correction Change the years for which Delegates and Alternate Delegates to the American Medical Association were elected from "1937-1938" as printed in the July 1, 1937 issue, to "1938-1939" That was a typographical error I move the acceptance of the minutes as printed, with that correction

The motion was seconded, and there being no discussion, was put to a vote and was unanimously carried

4 Reference Committees

SPEAKER KOPETZKY The appointments by the Speaker of his Reference Committees, Mr Secretary, please read the appointments

Secretary Irving read the Reference Committees for 1938 as follows

facility and enjoyment of the visting officers We presume that this service has been exceedingly satisfactory before. It is only just that I should carry over to you the satisfaction with which your President observed the consistent energized ability of Dr Lawrence The omission of this expression in the Annual Report was due to an official slip in preparing the final copy of our previous report.

Since the President's Annual Report was rendered to the Society, two expected events have happened in the legislative houses of our country The United States Senate has passed a bill under the aegis of Senator Wagner for the investigation of provision of health and medical care for the people of the United States The appropriation is $50,000 In the New York State Assembly, Robert Wagner, Jr introduced a bill for the study of State conditions of health and medical care and this bill passed by both houses has recently been signed by the Governor The appropriation in this case is $15 000 These two actions were prophesied and expected at the time of the writing of the President's Annual Report. Therefore, the renewal of the conflict between the enemies of modern medicine and medical organizations will test our every effort and resource in the immediate future. Hence your President's recommendation for an increase in dues and the appointment of a liaison officer of extraordinary knowledge and ability We must have the means and the command of abilities with which to engage competently and confidently in the defense of what is right or we must lay meekly and weakly down and let wrong prevail

At the Annual Convention of the American College of Physicians, the President of that organization saw fit to launch some polemic phrases which the newspapers interpreted as signifying a great conflict within the ranks of organized medicine. The Council of the organization prepared an announcement in which they declared the views expressed were not the opinions of the College and to this President Means cheerfully subscribed his name If any of our membership saw only the first newspaper reports, it is wise for them to take cognizance of the fact that the organization disclaimed any responsibility for the views contained in the President's address It is well for all officers in organized medicine to be cautious and be on solid ground before they make expressions of personal opinion in public that may be interpreted as opinions of the organization

Since the Annual Report was furnished we have received from the American Medical Association a request for a survey of medical care furnished in each County of our State—a part of a nation-wide survey The report of the special committee of the Council is included in the Supplementary Report of that body Your President *recommends* that every possible effort be made to cooperate with the national organization in this admirable work, details of which must be managed by some specially designated persons at headquarters

Your President wishes to thank the District Branches and County Societies for the invariable courtesy and cordiality with which he has been received upon all of his visits He regretted that it was an impossibility physically to accept all invitations Had it been feasible nothing would have been more heart-warming than visiting all I hope that we are a better knit organization for the year that has passed. Intimate, harmonious, constructive thinking should be the watchword of the hour Any other course means great danger at an extremely dangerous time. May we make *good*, righteous, helpful history of medicine during this session!

SPEAKER KOPETZKY Referred to Reference Committee on Presidential Address, Dr John Bauer, Chairman.

7 Address of President-Elect

Section 64

SPEAKER KOPETZKY Will Dr Aranow escort the President-Elect to the platform?

The delegates arose and applauded as Dr Aranow escorted President-Elect Groat to the platform

VICE-SPEAKER FLYNN May I introduce to you Dr William A Groat, President-Elect (Applause)

PRESIDENT-ELECT GROAT The custom which calls for a report from the President-Elect gives me pleasurable opportunity to thank you, the House of Delegates, for the honor which you have conferred upon me. It also seems proper at this time to tell you as seriously as I may of the good intentions I have for fulfilling the forthcoming obligations which acceptance of this honor has imposed

From time to time there have been changes in the governmental policies of the Society Over the entire period of its existence, however, certain general principles have been secure regardless of changing conditions One of the most important of these fundamentals is that the House of Delegates is the supreme controlling body and that the component sovereign County Societies through their representatives make up this, our legislative body The annual meeting from the first has been a combination of scientific attainment, business transaction, and good fellowship These are the things which should be preserved forever

One year ago to the end that the traditions of the Society be preserved and the business of the Society which has increased so enormously, be carried on as closely as possible to the original plan, yet as promptly and efficiently as the growth of ideas seems to demand a new constitution and by-laws was adopted by you We are greatly indebted to the committee which so carefully studied the governmental practices of the past and formulated policies suited to the tempo of the present. In operation now not yet one year, the plan has functioned and has shown its possibilities for orderly government. Certain minor defects may have appeared as might be expected in an instrument of this kind. It would be strange indeed to believe that a new setup could reach its full effectiveness and that there could be extracted from it all possible benefits in these few months To have had that expectation would have been presumptuous indeed. Therefore, pointing out to you the atten-

(The Speaker then read out the assignments which he had made for the Reference Committees on the various reports with particular attention to the distribution of the numbered topics in the Council Report, as indicated under the titles of the Reference Committees in Section 4—*Secretary*)

SPEAKER KOPETZKY Topic No 20 of the Council Report, "Amendments to the By-Laws," which the Council has submitted will come on the floor of the House at its next session in 1939

The supplementary reports that are at hand are referred as follows The Supplementary Report of the Council on "Report of the Detroit Plan of Tuberculosis Case Finding," to Council Committee No II, Supplementary Report on "Directory Frequency," to Council Committee No III, the Trustees have handed in a supplementary report, and their recommendations Nos 1 and 2 also go to Council Committee No III, the rest of the Trustees' report goes to Reference Committee on the Reports of the Treasurer and Trustees, there are three sections, "B", "I" and "J" of the report of the Council that go to Council Committee No IV, Dr Mott just spoke of an appendix that he was incorporating in his report, and that is sent, and hereby referred to Council Committee No VI, there is a supplementary Report from the Council on a 'Proposed Plan for County Society Study of Medical Care," caption 'H", and that goes to Council Committee No VI There is a supplementary report from the Council, on the "Deaf and Hard of Hearing," caption "D", and that is referred to Council Committee No I There is a supplementary report from the Council on a Section or Session on Gastroenterology, caption "G", and that is hereby referred to Council Committee No VIII The supplementary Report of the Treasurer and the financial portion of the Board of Trustees' report, as well as Recommendations 3, 4 and 5, are referred to the Committee on Reports of Treasurer and Trustees, the supplementary report on "Malpractice Insurance," caption 'F' is hereby referred to the Committee on Report of Legal Counsel There is a supplementary report captioned 'C", "District Branch Executive Committee Meetings—Report of Executive Officer," and that will go to the Committee headed by Dr Van Kleeck, "Reports of Secretary, Censors and District Branches"

SECRETARY IRVING There are two more supplementary reports

SPEAKER KOPETZKY I am informed that Dr Cottis has a supplementary report from the Board of Trustees The Chair recognizes Dr Cottis It has been printed

DR. GEORGE W COTTIS Is anything more necessary than to have it printed?

SPEAKER KOPETZKY It is assigned to the Reference Committee on Report of the Board of Trustees

I understand the Treasurer has a supplementary report.

DR. GEORGE W KOSMAK That has been mimeographed and distributed to all of the members of the House of Delegates

SPEAKER KOPETZKY It is referred to the Reference Committee on the Treasurer's Report

Recommendations 1 and 2, of the Supplementary Report of the Trustees, as previously announced, is referred to Reference Committee on the Report of the Council No III, and the financial portion and Recommendations Nos 3, 4 and 5, to the Reference Committee on Reports of Treasurer and Trustees That straightens that out.

5 Introduction of Guest

We have in the room here this morning a very distinguished guest who comes from overseas He is visiting these United States, and is our guest speaker I have seen the quality of his presentation in a special field I would ask Dr Chas Gordon Heyd to escort Mr Victor E. Negus of London to the platform, so that we may greet him officially

The delegates applauded as Dr Chas Gordon Heyd escorted Mr Victor E. Negus to the platform

MR. VICTOR E NEGUS It is the very greatest of honor to me, Mr President and Gentlemen, to be here today I can assure you that I appreciate your kindness very much indeed I have been at meetings at Atlantic City of the Laryngological and Otological Societies, and I have been deeply impressed with the kindness that I have received at all hands I have always been proud of being a member of the medical profession, but when I see the kindness and mutual help that are displayed in this country towards our rather distressed country, it makes me still more proud to be a member of this profession Thank you very much indeed!

6 Address of the President

Section 63

SPEAKER KOPETZKY I am going to ask Dr Trick and Dr Fisher to escort the President to the platform

The delegates arose and applauded as Drs Trick and Fisher escorted President Goodrich to the platform

SPEAKER KOPETZKY This gentleman needs no introduction anywhere in the State of New York He will present what he pleases, but particularly his address

PRESIDENT GOODRICH My address, ladies and gentlemen, will take the form of a very brief supplementary report to that report which was published in the JOURNAL of April 1

I want to say I thank you for the cordial welcome, and I hope that you will find this meeting throughout a very helpful and a very inspiring affair

In my previous and published report there was a serious omission The value of Dr Joseph Lawrence in our legislative work is well understood Your President wished to especially commend Dr Lawrence for the thoughtful and energetic competency with which he assisted in the direction of the District Branch meetings during the year He was helpful in arranging dates, in suggesting types of programs, many of which were original, and in assuring the provision of every detail which made possible not only very successful meetings but all those arrangements which contribute so much to the

SPEAKER KOPETZKY Evidently they are not here.

From the Medical Society of New Jersey, Drs William J Carrington and Thomas K Lewis!

(There was no response.)

SPEAKER KOPETZKY They are not here.

Dr George G Marshall, from the Vermont State Medical Society

(There was no response.)

SPEAKER KOPETZKY In absentia I greet them (Laughter)

I am, however, definitely informed that there is a guest here from another state society who because of some lack of detail, failed to function and give him the necessary credentials, but he is here, and it is a particular pleasure to welcome him Anyone having to do with forestry knows that he who does not take care of an after-growth is a very poor forester We have had a very distinguished man at the head of our organization for the last year I want to show you the after-growth From Missouri there comes his son, Dr Howard Brant Goodrich Will you rise, sir? (Applause)

SPEAKER KOPETZKY Dr Goodrich, young as he is, but experienced in the teachings of his father, is already busily engaged in the affairs of Organized Medicine. We wish you luck

Are there any other reports or supplementary reports?

I recognize Dr Chas Gordon Heyd

10 Executive Session

DR. CHAS GORDON HEYD I would move you that the Speaker declare the evening session of the House of Delegates that meets after the dinner this evening as an executive session, and that the Speaker be instructed to appoint marshals to see that only duly accredited members of the House of Delegates are present.

The motion was seconded, and there being no discussion, was put to a vote, and was unanimously carried.

SPEAKER KOPETZKY That seems to me to be, and is, unanimously carried The Speaker declares that the session tonight shall, and is, to be an executive session, and he hereby appoints Drs Arthur J Bedell as Sergeant-at-Arms or Marshal, George W Kosmak, and George M Fisher

Is there any other business to come before the session? I am ready to receive resolutions

11 Review of State Society Expenditures for Last Five Years

Section 58

DR. EDGAR A VANDER VEER, *Albany* I am directed by the County of Albany to present the following resolutions

WHEREAS, the work of the Medical Society of the State of New York has grown so extensive that it has become necessary to divide it among committees with substantial budgets, and

WHEREAS, the State Committees try to work through the respective County Committees, which apparently should also have financial resources, and

WHEREAS, the County Societies have too little information available on which to base the estimate of the budgets that should be allowed to these respective committees, therefore be it

Resolved, that the Medical Society of the State of New York prepare and furnish the County Societies with a detailed statement of the amounts budgeted annually in the last five years to the several Standing and important Special Committees and the detailed amounts expended by them respectively in that time, be it further

Resolved, that the President of the State Society be authorized and directed to appoint a special committee of five members to critically review the expenditures, and detail, insofar as practical, the actual benefits accrued to our membership in particular and the public in general by the expenditures of these funds during the past five years and that the committee be directed to file its report together with its recommendations concerning future spending policies at the next meeting of the House of Delegates, be it further

Resolved, that the Board of Trustees of the State Society be directed to appropriate a sufficient sum to reasonably cover the cost of this study

SPEAKER KOPETZKY Referred to Reference Committee on New Business A

12 Compulsory and Voluntary Health Insurance

Section 53

DR. EDGAR A. VANDER VEER I am directed by the County of Albany to present another resolution, as follows

WHEREAS, the Medical Society of the State of New York has always opposed the enactment of any compulsory health insurance law, and

WHEREAS, it is a recognized fact that most states or countries having compulsory health insurance began by promoting voluntary insurance or indemnity schemes, and

WHEREAS, there have been bills before the Legislature providing for legislation that would enable the creation of compulsory or voluntary health and medical indemnity organizations under various names, be it therefore

Resolved, that the Medical Society of the State of New York maintain its vigorous opposition to all types of compulsory and voluntary health insurance measures by whatever name known unless a decision to the contrary is reached only in the House of Delegates meeting in either regular or special session

SPEAKER KOPETZKY Referred to Reference Committee on New Business B

13 Licensing of Foreign Physicians

Sections 33–35–36

DR. MORRIS MASLON *Warren* The resolution I am about to introduce concerns Licensing of Foreign Physicians

WHEREAS, at this period in the history of our

tion which must be given and the spirited co-operation which must be engendered to fully consolidate the advantages obtainable through this fine instrument, must not be considered criticism of the manner in which the introduction of it has progressed during this short period. The particular things which were hoped for from the start—reached for by all and not yet fully obtained—are (1) a stronger and more positive financial control, (2) simplification of committee assignments to avoid unnecessary overlapping and duplication, (3) expeditious dispatch of the business of the Society by the Council, (4) clearer definition of the part which the Board of Trustees should play in financial policies

A definition of the duties of each of our full-time officers and employees and the building of precedents which shall govern their actions and their interrelations are essential in final detail

There is nothing elaborate about this program It is merely a continuation of what has been going on during the past year It is not the intent of the new constitution that the President of the Society shall dominate its activities That is a function reserved to you, the House of Delegates, during your session, and, during the interim, to the Council, each member of which is elected by you It is the Council, a reasonably small, compact body, which must learn, understand and develop its own duties and learn to accomplish its work expeditiously in accordance with present-day business standards With the staggered terms of office for councilors, an informed nucleus should be preserved in this, the controlling body, in the interval between the meetings of the House of Delegates t is to these experienced councillors and newly ected members added each year that we must ok for the maintenance of a government which is continuous, has general broad policies capable of normal conservative growth, and a business control which shall have the firmness and resiliency which only a durable, elastic body can develop

It seems clear that no immediate governmental changes are necessary, and that no special authorities need be given In my opinion the new constitution and by-laws set up all the machinery, grant all the authority, and assume all the prestige necessary for specific accomplishments The complete divorcement of the Board of Trustees from the Council to sit as a wholly separate appropriating and financial agency possessing only veto power on all appropriations of money, is workable but undesirable It is my opinion that through precept, precedent, and assignment, it may be established that the Board of Trustees also may have voice in the creating of financial policies and in the rejecting of impractical ideas for the expenditure of money at their inception I, therefore, pledge you strict attention to the business of the Society during the term of office as presiding officer of the Council so soon to begin The times demand the elimination of waste It shall be an important duty to conserve our resources, give tangible return for monies expended, and increase rather than diminish ponderable values to be distributed equitably to our members

SPEAKER KOPETZKY That will be referred to the same Reference Committee on Presidential Addresses, Dr John Bauer, Chairman

8 Supplementary Report on Workmen's Compensation

Section 55

DR. DAVID J KALISKI, *New York* I wish to make this supplementary report which has not been distributed—on behalf of the Workmen's Compensation Committee of the Council Under date of May 4, 1938, the following communication was received from Elmer F Andrews, Industrial Commissioner of the Department of Labor of the State of New York

"Pursuant to Section 13, Chapters 258 and 930 of the Laws of 1935 amending the Workmen's Compensation Law, and as a result of committee meetings and public hearings, I prepared and established a minimum medical fee schedule for medical treatment and care of injured employees under the Workmen's Compensation Law applying to the Metropolitan District of New York City effective May 1st, 1936

"Since then special committees have been appointed to secure and give careful study to data and information on the prevailing rate of fees paid for medical treatment and care rendered to injured employees in the upstate area

"As a result of evidence submitted at public hearings held on the upstate medical fee question and the special study and careful consideration given to this problem by the membership of the special committee appointed for that purpose and on the recommendation of the Industrial Council, I hereby rule and do adopt and establish the minimum medical fee schedule now in effect for the Metropolitan district of New York City, to apply to the entire state effective May 15th, 1938"

SPEAKER KOPETZKY It is referred to the Committee having the matter in charge

DR. DAVID J KALISKI, *New York* I would like to take this opportunity to congratulate the Industrial Commissioner, and to thank the members of the Industrial Council and the members of the Workmen's Compensation Committee who have been so industrious in bringing the prevailing rates throughout the state to the attention of the Commissioner

SPEAKER KOPETZKY At the proper time, sir, it would be perfectly in order for you to make a motion that proper letters or telegrams of thanks be sent, at the present time, it is not.

9 Introduction of Delegates from other State Medical Societies

SPEAKER KOPETZKY It is my pleasure to introduce the following guests, if they are present. I have been notified that they have been appointed and if they are present I shall ask them to kindly arise

From the Connecticut State Medical Society, Drs D Chester Brown and Stanhope Bayne-Jones!

(There was no response.)

15 Ex-Mental Hospital Patients—a Menace as Automobile Drivers

Sections 49–62

DR. CLARENCE V COSTELLO This concerns the menace of ex-state mental hospital patients as automobile drivers

WHEREAS, in the State of New York, there are annually admitted to the State Mental Hospitals approximately fifteen thousand patients, and forty-five per cent of these are discharged or paroled, and

WHEREAS, a large number of those discharged or paroled are automobile drivers, many of whom are a potential menace, be it

Resolved, on the recommendation of the Committee on Nervous and Mental Diseases that the Medical Society of the County of Monroe urge that some measure be had requiring the notification to the Motor Vehicle Bureau, of all patients discharged or paroled from State and Private Mental Hospitals in the State of New York, so that appropriate action may be taken by the Motor Vehicle Bureau, and be it further

Resolved, that a copy of this resolution be sent to the Council of the Medical Society of the State of New York.

That was adopted by the Committee on Mental and Nervous Diseases, November 30, 1937, approved by Public Health Committee, December 8, 1937, approved by Comitia Minora, December 20, 1937, approved by Medical Society of the County of Monroe, December 21, 1937

SPEAKER KOPETZKY Reference Committee on New Business B

16 Medical Advisory Committee to the State Wagner Act Commission

Section 56

DR. GEORGE BAEHR, *New York* I have a resolution to present

WHEREAS, the Wagner Act includes only one physician on a Commission of thirteen members which is to survey and make recommendations concerning medical care for the people of the State of New York, be it hereby

Resolved, that the Medical Society of the State of New York respectfully request His Excellency, the Governor, to designate a medical committee of distinguished physicians to act in an advisory capacity to the Commission, and be it further

Resolved, that in making this request, the Society call attention to the effective work of the former Governor's Committee on the Medical Abuses of the Workmen's Compensation Act, whose findings and recommendations resulted in widespread corrective changes in the medical provisions of this law

SPEAKER KOPETZKY Reference Committee on New Business A

17 Statement of Public Policy for Cooperation with Official and Voluntary Lay Agencies for Provision of Medical Care

Section 52

DR. MERWIN E. MARSLAND, *Westchester* I have two resolutions to present The first is

Resolved, that the following statement of public policy be hereby adopted and expressed by the Medical Society of the State of New York, and recommended to the American Medical Association, to the end that the American medical profession, through its duly constituted and recognized organization, may commit itself to a logical, affirmative and progressive policy through which it may proceed, in cooperation with official and voluntary lay agencies throughout the nation, to the provision of good medical care to every deserving citizen of the United States

Statement of Four Principles

1 We believe and assert that good medical care can be made available to the poor and to persons in the lower income classes, through more rational economic arrangements than have yet been developed, and under the same conditions of freedom and privacy as obtained for their more fortunate self-sustaining neighbors,

2 We submit that the medical profession has no valid objection to, but should endorse and encourage, the establishment of experimental programs of mutual or public assistance designed to aid such people in obtaining the benefits of good medical care, without resort to medical charity, provided only that in the administration of such programs, the function of the lay agencies involved must be limited and confined to the economic and financial aspects of the programs,

3 We submit that the medical profession must and should insist, in the public interest, that the medical and professional aspects of any and all such programs shall be administered, controlled, evaluated and operated under the responsibility of the organized medical profession, entirely free of political interference or lay dictation,

4 We submit that wherever any such plan of mutual or public assistance may be proposed, the approval and cooperation of the organized medical profession should be anticipated, provided that this clear and logical division of function and responsibility between the economic and the professional aspects is observed and properly implemented in the legislation under which the plan is to be established, or the articles of agreement under which the parties to the program propose to operate, and provided further that such plan is adapted to the local conditions of the community to which it is intended to be applied.

In summary we submit that

1 Organized medicine should favor such programs as will make good medical care more available than at present—by improved economic arrangements

2 Lay agencies must confine their functions to the non-medical aspects of any plans for that purpose.

3 The medical aspects of such plans must be absolutely and solely in the hands of the organized medical profession.

4 These two functions must be kept clearly inviolate and the status of the organized medical profession firmly established by suitable legislation.

local and state Society, New York State is becoming a haven for many foreign physicians whose place in their native lands has caused them to come here, and

WHEREAS, during the past ten years 800 foreign physicians have been granted licenses to practice in this state, and

WHEREAS, our own native physicians have been required to undergo schooling and training which has become markedly more expensive during recent years, and

WHEREAS, foreign nations have for years protected the members of their medical profession from outside competition, therefore be it

Resolved, that the Medical Society of the County of Warren now propose that action be taken by the House of Delegates at the annual meeting to direct the Medical Society of the State of New York to sponsor appropriate legislation whereby qualifications for granting of licenses to physicians of foreign countries be made as rigid as those qualifications now in force for practicing physicians of the State of New York, be it further

Resolved, that a copy of this resolution be immediately forwarded to the Secretary of the Medical Society of the State of New York, and be it further

Resolved, that the Delegate of the County of Warren be instructed to sponsor or support a resolution to the above effect

SPEAKER KOPETZKY Reference Committee on New Business C.

DR. J F GALLO, *Herkimer* This concerns the same subject

WHEREAS, at this period in the history of our local and State Society, New York is becoming a haven for many foreign physicians whose persecution in their native lands has caused them to come here, and

WHEREAS, during the past ten years, at least eight hundred foreign physicians have been granted a license to practice in this state, and

WHEREAS, our own native physicians have been required to undergo schooling and training which has become markedly more expensive during recent years, and

WHEREAS, foreign nations have for years protected the members of their medical profession from outside competition, therefore be it

Resolved, that the Medical Society of the County of Herkimer now proposes that action be taken by the House of Delegates to urge the State authorities and the Board of Regents to take some definite action to protect the practicing physicians of New York State from foreign physicians, and be it further

Resolved, that the rules governing the granting of a license to practice medicine to these foreign physicians coming to New York State be *at least* as rigid as those rules which would apply to our own physicians should they attempt to obtain a license to practice in the countries from which these men come.

I have been instructed by the Medical Society of the County of Herkimer to present that resolution.

SPEAKER KOPETZKY Reference Committee on New Business C.

DR FRANK MAZZOLA, *Queens* This concerns the influx of foreign medical graduates

WHEREAS, there has been a large influx of foreign medical graduates establishing practices in New York State, and

WHEREAS, these physicians are *not* familiar with the Code of Ethics governing the medical profession in this State, and

WHEREAS, a large number of such physicians violate the Code of Ethics before they are admitted to Organized Medicine, therefore be it

Resolved, that the Medical Society of the State of New York recommend to the State Board of Medical Examiners that such physicians be given a copy of the Code of Ethics when making application to participate in examinations to practice medicine.

SPEAKER KOPETZKY Reference Committee on New Business C

14 Public Hearings of Medical Testimony under Workmen's Compensation Law

Section 48

DR. CLARENCE V COSTELLO, *Monroe* I have two resolutions from the Medical Society of the County of Monroe

The first is regarding the amending of the rules of medical testimony of hearings administered by State Department of Labor

WHEREAS, under the rules of the Workmen's Compensation Law, administered by the Department of Labor of the State of New York, it is required that all hearings, including lay as well as medical testimony, be held in public and in the hearing and presence of the claimant and others, and

WHEREAS, physicians having to testify necessarily have to be descriptive of the patient's illness or accident, and factors leading up to the same, and

WHEREAS, the medical profession recognizes most acutely the destructive influence of such testimony on the patient and other witnesses at such hearings, be it

Resolved On the recommendation of the Committee on Nervous and Mental Diseases that the Medical Society of the County of Monroe request the Medical Society of the State of New York to petition the Department of Labor of the State of New York, to amend its rules of procedure so that all medical testimony be held only in the presence of the referee, the claimant, and the legal representatives of the claimant and carrier, and that no attorneys, or insurance adjusters, other than those involved in the case, should be present, and be it further

Resolved, that a copy of this resolution be sent to the House of Delegates of the Medical Society of the State of New York.

That has been adopted by the Committee on Mental and Nervous Diseases, November 30, 1937, Approved by Public Health Committee, December 8, 1937, Approved by Comitia Minora, December 20, 1937, and Approved by Medical Society of the County of Monroe on December 21, 1937

SPEAKER KOPETZKY Reference Committee on New Business B

DR. ARTHUR J BEDELL, *Albany* I move you, sir, that we disapprove of the suggested change

SPEAKER KOPETZKY Would it not be better, Dr Bedell, if the House concurs, that a motion for the adoption of such change be defeated, in other words, affirmative action is better than a negative one.

DR. BEDELL I accept your words

DR. J RICHARD KEVIN, *Kings* This apparently has escaped my vision. I little dreamed that this would come up again For years New York has been trying to get this through. When I say "trying" I mean has made efforts to get it through I was delegated as a delegate from Kings County to meet and obstruct it. And why? Because if this passes, there is no use of bringing you men here from upstate. Kings and Manhattan will do the job for you

SPEAKER KOPETZKY Dr Kevin, the Speaker does not like to interupt your flow of oratory, but there is no use shooting at dead men This resolution was not introduced by New York County

DR. KEVIN I did not say it was, but I said New York County for years tried to get it through. New York County has presented this year after year It first started about fifteen years ago We always have thought it was an injustice to have any one section or any one large area do all of our legislating for us If Kings and New York Counties can do it all why should the upstaters come down here and take part in this House of Delegates? I believe, sir, we should stick to the old theory We were given this privilege by the Legislature years ago when we started. Our fathers will turn over in their graves if you change this Why? Because it represents every county as it is now, without the fear of the larger cities controlling I am against the thing

DR. FLOYD S WINSLOW, *Monroe* That motion was not seconded, was it?

SPEAKER KOPETZKY If it has not been seconded, the motion as I understood it was on the adoption of the defeat of these amendments to the Constitution

DR. WINSLOW Dr Bedell made the motion that the House of Delegates disapprove of the change. In order to keep Dr Kevin's ancestors from turning over in their graves, and seconding the sentiments of the delegate from Albany who believes in thoughts and not words, I second the motion

SPEAKER KOPETZKY The point is this The resolutions amending the Constitution were introduced last year A motion was made that this House disapprove of them. You may vote to disapprove of them, but you will have to defeat these resolutions before you dispose of them. The Chair suggested that you deal with the resolutions, and if you do not like them, defeat them

DR. BEDELL But I most graciously accepted your rewording, and I therefore ask the stenographer to read the motion as I accepted it

The reporter read back Dr Bedell's original motion, the Speaker's comment thereon, and Dr Winslow's second

SPEAKER KOPETZKY The question before the House is on the adoption of the resolutions as presented, what is your pleasure?

DR. WALTER D LUDLUM, *Kings* What does the resolution provide for?

Secretary Irving re-read the resolutions and the substituted amendment.

DR. LUDLUM I move that this resolution be deferred to a session of the House after individual roll call has been had

The motion was seconded.

SPEAKER KOPETZKY A privileged motion to defer action until what time, sir?

DR. LUDLUM After the individual roll call has taken place

SPEAKER KOPETZKY Until after the individual roll call has taken place

The motion was put to an "aye" and "nay" vote and as the Chair was in doubt it was put to a rising vote, and declared lost.

SPEAKER KOPETZKY The question is now on the adoption of the resolutions

There being no further discussion, the motion was put to a vote, and was lost

SPEAKER KOPETZKY The resolution as presented a year ago is lost

20 Election of Honorary Member

SPEAKER KOPETZKY Mr Secretary you have one further matter, as I understand it, that has lain over since last year?

SECRETARY IRVING There is a nomination for Honorary Membership for Dr Jose Arce of Buenos Aires This was presented to the last House signed by three members of the Society, as prescribed by Chapter I, Section IV, of the old By-Laws

This is the letter of nomination

"Gentlemen

"The undersigned members desire to nominate for honorary membership in the Medical Society of the State of New York Dr Jose Arce, Professor of Surgery, University of Buenos Aires, Buenos Aires, Argentine.

"We beg to present this at the meeting of the House of Delegates in May, 1937, as prescribed by the By-Laws, Chapter I, Section IV

"Very truly yours,
(Signed) Floyd S Winslow
Joseph J Eller
Chas Gordon Heyd"

A vote was taken, and Dr Jose Arce was unanimously elected an honorary member of the Medical Society of the State of New York.

21 Medical Assistance Bill

Section 59

DR. HARRY ARANOW, *Bronx* I am sorry, but a resolution has just been handed to me, which I should like to present.

SPEAKER KOPETZKY Let us have the resolution from the Bronx.

DR. ARANOW This is practically the same resolution as was approved by Westchester County, and read before, but it is worded a little differently

WHEREAS the Medical Society of the State of New York, adopting a National Public Health Policy, proposed that '2 An immediate

SPEAKER KOPETZKY Pardon me, but what is your resolution?

DR. MARSLAND *Resolved*, that the following statement of public policy be hereby adopted and expressed by the Medical Society of the State of New York, and recommended to the American Medical Association, to the end that the American medical profession, through its duly constituted and recognized organization, may commit itself to a logical, affirmative and progressive policy through which it may proceed, in cooperation with official and voluntary lay agencies throughout the nation, to the provision of good medical care to every deserving citizen of the United States.

SPEAKER KOPETZKY It was just a rather unique way of putting a resolution in parliamentary form Pardon my ignorance for questioning it Referred to Reference Committee on New Business B

18 Basic Principles for Permanent Program of State Medical Welfare Service

Section 57

DR. MARSLAND I have another one

WHEREAS, the State Department of Social Welfare is reported to be considering a general revision of the rules and regulations pertaining to medical welfare service throughout the State, and

WHEREAS, a committee of the Council of the Medical Society of the State of New York is reported to be conferring with the State Department of Social Welfare, with a view to "Formulation of rules satisfactory to both the Department and the Profession," now therefore, be it

Resolved, by the Medical Society of the State of New York, for the information and guidance both of its own representatives and the State Department of Social Welfare, that it is the sense of this Society that any permanent program of medical welfare service, to be satisfactory and acceptable to the medical profession of this State, must conform with the following general stipulations

(1) The medical aspects of medical welfare service should be placed under the effective control and supervision of the organized medical profession, in somewhat the same manner as the medical aspects of Workmen's Compensation Service are controlled and supervised

(2) The participation of the entire profession in medical welfare service should be encouraged by minimizing the red tape and onerous regulations and by a policy of reimbursing local welfare officers on the basis of local fee schedules in accordance with the prevailing minimum fees in their localities as determined by conference between the local welfare officers and the local county medical society

(3) The welfare patient should be given effective free choice of physician, under the same protective limitations as are provided for the injured workmen under the Workmen's Compensation Law

(4) The provision of medical welfare service by local governments through county, city or town physicians serving under contract should be actively discouraged and disapproved as a policy

(5) Provision should be made and standards of eligibility established according to which needed medical care would be furnished for indigent and near-indigent families not otherwise eligible for material relief

(6) The routine use of clinics by public welfare authorities, thus avoiding payment of fees to private physicians, should be stringently limited, and made subject to medical consideration rather than economic considerations

SPEAKER KOPETZKY Reference Committee on New Business A.

19 Amendment to Constitution and By-Laws

(Component County Society Delegates)

SPEAKER KOPETZKY Gentlemen, there is on the desk an amendment to the Constitution which was presented last year, published once, and now legally before you The Secretary will read it.

SECRETARY IRVING Re Component County Society Delegates This was introduced on May 25, 1937, and is taken from the minutes

"THE SPEAKER We have the following resolution

"WHEREAS, the Constitution and By-Laws provide that each component county society shall be entitled to elect as many delegates as there shall be assembly districts in such county at the time of election, and

"WHEREAS, such representation is supposed to be based on population but in fact is not so based because of the failure of the State Legislature to make reapportionment, and

"WHEREAS, this Society should and can do away with political boundaries within the counties as far as it affects this body,

"*Therefore*, be it resolved, that each component county Society shall be entitled to elect at least one delegate, and one additional delegate for each 100,000 population as determined by the last United States census

"DR KRAKOW, *Bronx* May I move the following substitution as an amendment

"Each component county society shall be entitled to elect one delegate for each 100 members in such county at the time of election, but each component county society shall be entitled to elect at least one delegate. A component society representing by its name more than one county shall be entitled to a number of delegates proportionate to its combined membership at the rate of one delegate for one hundred members"

SPEAKER KOPETZKY The pending question is the adoption of this amendment to the by-laws What is your pleasure? This proposes an entire change in the House of Delegates, a different way of electing the delegates by popular concern called proportionate representation

DR. FRANK L. SULLIVAN, *Schenectady* I would like to ask a question This amendment as read, does that mean one delegate for each 100, and one extra delegate for each part of 100 members thereafter?

SPEAKER KOPETZKY Yes, sir

SPEAKER KOPETZKY The House will be in order

25 Report of Committee to Secure Gift for Miss Baldwin

SPEAKER KOPETZKY The Chair recognizes Dr Barringer

DR. EMILY D BARRINGER, *New York* I wish to make a report in regard to the gift that the House of Delegates gave Miss Baldwin on the occasion of her retirement If you will recall, at the last meeting an informal collection was taken up by the House of Delegates A committee of three were appointed, I being Chairman, with Drs Van Etten and Ratnoff, to buy an appropriate gift for Miss Baldwin. We had a committee meeting, and found we had $163 to spend We were fortunate in being able to go to Tiffany's and buy a wristwatch for Miss Baldwin We were able to get a very beautiful platinum, diamond-studded watch, and had the following inscription put on the back of it

LILY D BALDWIN

for

Distinguished Services

from the

House of Delegates

Medical Society of the

State of New York

Miss Baldwin was perfectly thrilled with the gift, and has written this letter, which I want to read to you at this time

"Dr Emily Dunning Barringer,

Chairman Committee appointed by the House of Delegates to select a gift to be presented to Miss Baldwin when she retired

My dear Dr Barringer

I wish to thank you and the House of Delegates through you, for the lovely gift which was sent me on my retirement. The watch, a wonderful timepiece, is a beauty and something I am particularly glad to have as it is my constant companion and goes with me everywhere a reminder, if it were necessary, as it it not of the courtesy, consideration, generosity and friendship which it has been my privilege to enjoy during the happy years when I was with the Society

Once more expressing my appreciation of the beautiful gift as well as of the thought which prompted it, which is perhaps even dearer to my heart, I am

Very sincerely,

(Signed) Lily D Baldwin."

SPEAKER KOPETZKY Read for information.

DR. BEDELL I would like to make a motion apropos of this, if you will entertain it

SPEAKER KOPETZKY You have the floor

DR. BEDDELL I move you, sir that the House of Delegates, through its Secretary Dr Irving, send a letter of appreciation to Miss Baldwin, one of recognition of her years of service and one expressing our kindest regards and our hope that she may live long to enjoy the years of greater freedom that have come to her

DR. GEORGE W KOSMAK, *New York* I second that

There being no discussion, the motion was put to a vote, and was unanimously carried.

SPEAKER KOPETZKY Is Dr George G Marshall from the Vermont State Medical Society in the room?

There was applause as Dr Marshall arose.

SPEAKER KOPETZKY Dr Marshall, I called for you this morning I extend to you a cordial welcome. You come from quite a distance. You have the privileges of the House. We are glad to have you with us as a delegate from the Vermont State Medical Society to the Medical Society of the State of New York (Applause)

Are any of the reference committees ready to report?

26 Directory Listing of Members

Section 61

DR. B WALLACE HAMILTON, *New York* I have a resolution to present as follows

WHEREAS, the directory of the American Medical Association lists its members in bold faced type, and

WHEREAS, many non-members of the Medical Society of the State of New York have expressed a willingness to conform to the principles of Professional Conduct though being unwilling for economic reasons to join the Society, therefore be it

Resolved that the names of members of the Medical Society of the State Society shall be printed in the Directory in bold faced type, and be it further

Resolved the non-members signing an agreement to abide by the accepted principles of professional conduct shall have an appropriate symbol placed after their names

SPEAKER KOPETZKY Reference Committee B

27 Administrative Cost of Relief and Medical Care of the Poor

Section 82

DR. M RENFREW BRADNER, *Orange* This was passed at a stated meeting of the Orange County Medical Society held on April 12 1938

WHEREAS, the amount of medical care required by persons under the responsibility of various public agencies is steadily increasing, and

WHEREAS, it has been the experience of this Society working in cooperation with the County Government that these matters can be handled simply and economically through Town and County accounting, but that state regulations have developed an increasingly complicated mechanism of supervision and control, reduplicated in Town, County and State Departments, and that this great activity in accounting obviously indicates a vast expense to the public in buildings, personnel and maintenance, and that these departments anticipate in only a small degree the greater complication and expense of similar Federal Bureaus at present under consideration, and that available data would indicate that administrative cost of these depart-

problem is the provision of adequate medical care for the medically indigent, the cost to be met from public funds" (Booth Report of 1933), and

WHEREAS, certain proposals in keeping with the above were enunciated by the Public Relations Committee and the Comitia Minora of the Westchester County Medical Society and approved by its membership, and

WHEREAS, a bill, known as the Medical Assistance Law, was introduced in the New York State Legislature (Assembly No 2787, Int 2310), embodying the policy and proposals mentioned above, specifically providing for a method of administration, similar to the provisions of the Workmen's Compensation Act, under medical control and allowing for free choice of physician, therefore be it

Resolved, that this Medical Assistance Bill which failed of enactment be re-introduced this year, be carefully scrutinized, and altered in a manner that will be most valuable to the needy public and the medical profession, and be it further

Resolved, that this bill be referred to the Legislative Committee for study and possible revision, with the object of approving the principles set forth therein

SPEAKER KOPETZKY Reference Committee A who has the other matters on similar topics

22 Persecution of Austrian Professionals

Section 34

DR. EDWARD R CUNNIFFE, *Bronx* This resolution is presented by the Medical Society of the County of the Bronx

WHEREAS, it has ever been the pride of the medical profession to engage in vital humane and unselfish endeavor,

WHEREAS, medicine, like all science, transcends national and geographic boundaries,

WHEREAS, we American physicians have a double heritage that of our profession and as citizens of the world's greatest democracy,

WHEREAS, because of such tradition and background we are intolerant of foul play and indignities committed against defenseless victims within or outside our national boundaries, therefore be it

Resolved, that the New York State Medical Society register a forceful protest against the humiliation and persecution of Austrian professionals belonging to racial or religious minorities, particularly physicians so classified, be it further

Resolved, that our delegates be instructed to present these resolutions at the American Medical Association convention

SPEAKER KOPETZKY Reference Committee C

23 Insurance Committee

Section 51

DR. JOHN J MASTERSON, *Kings* I have two resolutions

WHEREAS, the operation of the Group Insurance Plan is an important undertaking of the State Society, requiring continuity of supervision, and

WHEREAS, the compilation and analysis of the cost data upon which our insurance rates are predicated are complicated and require long and thorough study by men familiar with the operation of the Group Plan and mathematical computations, and

WHEREAS, it is desirable and necessary that the Chairman of the Insurance Committee be, so far as possible, continued in office from year to year and that he be in New York City where he can frequently consult with the Insurance Representative, now therefore be it

Resolved, that the Treasurer of the State Society be designated as the continuing Chairman of the Insurance Committee

SPEAKER KOPETZKY Reference Committee on New Business B

24 Advisory Service on Malpractice Insurance

Section 50

DR JOHN J MASTERSON, *Kings* The second resolution

During the past few years there has been noted an increasing tendency on part of individuals and small groups to enter into negotiations with insurance companies other than the authorized carrier of the Group Plan without consulting the insurance advisory service provided by the Society This creates an impression of lack of solidarity within the Society to meet with combined force the ever increasing threat of malpractice actions

Several of the overtures that are now being made to members are without merit and may lead to unsatisfactory defense and indemnity of members who seek protection outside the Group Plan When beset by threats of malpractice actions, members naturally turn to the defense machinery of the State Society It would appear altogether proper and logical, therefore, to seek the advice and guidance of the State Society's insurance service before entering into insurance arrangements which may, when needed prove inadequate and unsatisfactory, therefore be it

Resolved, that when approached by representatives of insurance companies other than the authorized carrier of the Group Plan, members be urged to consult with the Insurance Committee, Insurance Representative or the Legal Counsel, before committing themselves to insurance arrangements other than those approved by the Society, be it further

Resolved, that a copy of this resolution be sent to each component county society with instruction that it be brought to the attention of their members

SPEAKER KOPETZKY Reference Committee on New Business B

We will now recess until two o'clock so that the Reference Committees may function If you have business with them they will be on the first balcony, and you can appear before them and present your views (At 11 45 A M a recess was taken)

Afternoon Session

May 9, 1938

The session convened at 2 o'clock, pursuant to recess

DR. HARRY P MENCKEN, *Queens* I move the adoption of the report, together with the recommendation of the Committee.

DR. THOMAS P FARMER, *Onondaga* I second that motion

There being no discussion, the motion was put to a vote, and unanimously carried

SPEAKER KOPETZKY I thank the Reference Committee for their work.

31 Report of Reference Committee on Reports of Treasurer and Trustees

Section 75

DR. L. H. BAUER, *Nassau* Report of Reference Committee on the Reports of the Treasurer and Trustees This report contains several recommendations which are somewhat interrelated, and I think the House could act more intelligently if I read the report through in its entirety, and then took up the specific recommendations one by one

The report of the Treasurer calls attention to the custom of the Society to meet running expenditures from the current dues and the margin between the two is constantly growing smaller leaving less and less to be added to the permanent fund.

There has been a further default in the bonds held to the amount of $5,000 This means a total default of $28,000 in par value or $25 364 at cost. There is a cheering note in that the stocks purchased in accordance with the resolutions of the House of Delegates in 1937, have not passed any dividends up to date, but the Treasurer feels that reductions from this source must be expected in the near future

In addition the Treasurer reports a reduction in the quoted market value of the securities held of $33,682 17 as of December 31, 1937 The amount received from dues was $153 500 and the expenditures $144,472 71 While this leaves an apparent surplus of $9,027.29 and even adding to this the interest of $10,204 10, received on capital the total of the two is still $14,414.24 on the short side. In other words the financial standing of the Society was in reality on December 31, 1937 over $14,000 worse than it was a year ago, and probably still worse at the present date.

Not all of this can be laid to increased expenditures as already indicated, but it does show the importance of leaving a greater leeway between current income and expenditures, in order to allow for possible further shrinkage in capital as well as a hoped for addition to capital

The Treasurer feels that the present permanent fund of the Society of $225,000 is not of sufficient volume and that it should be increased Your committee agrees with this

The Treasurer has attempted to give a comparison of the cost of the previous committee setup of the Society and the present Council Committee plan This has been difficult to do because of the different administrative and fiscal years of the Society, and because the latter plan has not been in effect quite a year However, in 1936, under the old scheme the special committee cost was nearly $47,000 In 1937, with six months of each setup the total cost was a little over $40,000 This is almost $7,000 less in cost and with a whole year on which to base it, it would probably show a still greater saving It would appear, therefore, that the present Council Committee plan was a forward economic step

The increases in the expense of administration have been (1) the employment of a full time general manager This has of course increased the cost of the main office Your committee feels, however, that this increase is justified and that the work of Dr Irving is worth to the Society much more than his salary

(2) The Public Relations Bureau is the largest item of committee expense. In 1936, the Committee on Trends spent nearly $21,000 In 1937, its successor, the Public Relations Bureau was responsible for a net expenditure of $15,600, odd Recommendations as to this Bureau will be made under the report of the Trustees

(3) The Social Security taxes are an increasing burden on the Treasury In 1937, they amounted to over $2,500 and the Treasurer estimates that in succeeding years they will total over $3,500 This is an expense about which we can do nothing but it is an additional sign of the necessity of conserving funds in other directions

The Treasurer ends his supplementary report with a warning that conservatism and a retrenchment in expenditures or a resort to an increase in dues is necessary He calls attention to the elementary principle of governing expenditures by receipts and allowing a surplus for emergencies and additions to the capital fund Your Committee agrees with this and compliments the Treasurer on his caution and conservatism Methods of carrying out his recommendations will be discussed under the Report of the Trustees

The Committee recommends that in the future the Treasurer's report to the House of Delegates give a fuller interpretation of the Auditor's report including a more detailed analysis of the expenditures of the Society so that the report will be more readily understood by every member, and will afford a clearer guide for future recommendations of expenditures

The Board of Trustees likewise sounds a note of warning on the ever-increasing costs of the administration of the Society and states that had the expenditures increased in proportion to the income during the past twenty years, as they have in the past few years, there would have been no trust fund. This is another way of saying that if the increase in expenditures continues, the trust fund will be wiped out. Not only is the increased expenditure of funds a factor, but the safety of our investments has been endangered by the existing financial condition at large.

They cite the fact that the total bond losses and decrease in market value of other securities held on April 11, 1938, come to over $52,500

The budget this year called for $149,000 in expenditures and the income from dues was $153,500 leaving a margin for emergencies of only $4,500 Last year this margin was over $6 000 This year there was also $4,500 allowed in the budget but not spent leaving an actual

ments already exceeds the actual cost of medical services rendered, therefore be it

Resolved, by the Orange County Medical Society that a letter be written to the Board of Supervisors of the County citing the above noted conditions and requesting its interest in an investigation of the administrative cost of relief and medical care of the poor, and be it further

Resolved, that this matter be presented to the State Medical Society through its House of Delegates requesting that further information be obtained from the State Department of Social Welfare pertaining to the administrative statistical and accounting expenses involved in its medical and relief activities for the fiscal year of 1936 and 1937

SPEAKER KOPETZKY Reference Committee A

28 Invitation to Buffalo for 1939 Annual Meeting

Section 81

DR. ALBERT GARTNER, *Erie* This is regarding the next meeting of the State Society

WHEREAS, the Medical Society of the State of New York has held the annual meeting but once in Buffalo since 1915, and

WHEREAS, the Medical Society of the County of Erie would consider it an honor and pleasure to act as your host, and

WHEREAS, except for the Metropolitan Area, Buffalo, being the second largest city in New York State, has more than ample hotel and hospital facilities, be it

Resolved, that the Council of the Medical Society of the State of New York be memorialized to hold the 1939 annual meeting of the Society in Buffalo, New York.

SPEAKER KOPETZKY Reference Committee A

29 Minimum Fee Schedule for Contract Practice

Section 54

DR JOSEPH WRANA, *Queens* (Subject) Minimum Fee Schedule for Contract Practice

WHEREAS, there is an apparent increase in lodge, group and contract practice, and

WHEREAS, there are springing up throughout the Metropolitan Area insurance groups purporting to furnish medical care on a voluntary health insurance basis, and

WHEREAS, these groups and lodges are beginning to manifest the underbidding and solicitation so undesirable in this type of practice, and

WHEREAS, there is no set standard of fees for this work, and

WHEREAS, the Commissioner of Labor has recently decreed that the fee schedule governing compensation practice in the Metropolitan Area be made state wide, therefore be it

Resolved, that the Medical Society of the State of New York go on record as demanding as minimum fee schedule for group, lodge or contract practice; the same schedule of fees as prevails in this state in compensation practice.

SPEAKER KOPETZKY Reference Committee C

30 Report of Reference Committee on Report of Council

Public Health Matters

DR. JAMES ALEXANDER MILLER, *New* Your Reference Committee has been re to review those portions of the Report Council which are contained in Paragraph and three of that report. This covers the jects of Pneumonia, Cancer, Syphilis, an Deaf and Hard of Hearing

Pneumonia

The Council has evidently been very pr erly impressed by the importance of havi all of our members kept abreast of the pro ress of modern medical knowledge relating the prompt diagnosis and adequate treatmen of pneumonia Their efforts in this direction are to be commended and should be energetically pursued in close cooperation with the Public Health authorities, and with the advice and counsel of its Committee on Matters Pertaining to Public Health

Cancer

The educational program carried on in cooperation with the American Society for the Control of Cancer should be continued

The representation of our Society upon the State Commission for the Study of Cancer and the work of this Commission should result in a definite advance in the knowledge of the prevalence of this disease in New York State

Syphilis

In recognition of the great potential value of the intensive efforts of the control of Syphilis which are being exerted by the United States Public Health Service and the New York State Department of Health, your Committee would recommend to the Council that every proper effort be made by the State Society to cooperate with this movement and would especially recommend that the importance of the training of proper personnel in this field be emphasized, not only as it applies to the staff of the Public Health Services but especially by recognition of the opportunities which would be afforded to the furtherance of this campaign if the services of the large body of practicing physicians are fully and properly utilized

The Deaf and Hard of Hearing

The progress which the Council reports to have been made through cooperation with the State Commission is very notable and all concerned with the accomplishment of the adequate program of education for this class of defectives are to be heartily congratulated

In conclusion, your Reference Committee is impressed by the need at the present time for a general survey of the field of public health as it concerns the medical profession of the State of New York

It consequently recommends to the Council that the Committee on Matters Pertaining to Public Health be instructed to make such a survey during the coming year in a manner similar to that pursued by the Committee on Matters Pertaining to Medical Care, and to report to the Council before the session of the Soci

The Committee, therefore, feels that it would not be advisable to raise the dues at this time, and except for the proposed assessment for Workmen's Compensation, recommends that no increase be made.

We will now turn to the specific recommendations, Mr Speaker "The Committee recommends that in the future the Treasurer's report to the House of Delegates give a fuller interpretation of the Auditor's report, including a more detailed analysis of the expenditures of the Society so that the report will be more readily understood by every member and will afford a clearer guide for future recommendations of expenditures"

I move the adoption of this recommendation.

The motion was seconded, and as there was no discussion, the recommendation was put to a vote, and was carried

Dr. Louis H Bauer "One recommendation by the Trustees is that the Publicity and Publication departments be merged This refers to a combination of the present Public Relations Bureau with the Journal Publication Department, the latter recommended by the Trustees No decision can or should be made on this until a definite decision has been reached about the Journal. In any event, the Committee deems it unwise to consider any consolidation until after a Publication Department has been established, provided such a step is taken. If the Society decides to establish its own Publication Department, then your Committee believes that the Public Relations Bureau should be merged with the Publication Department as the two Departments could be run more economically as one and without impairment of the efficiency of either"

I question whether we could take legal action on something which is predicated on something that may not happen

Speaker Kopetzky You can bring in your recommendation, and your Committee will not be discharged, since it has this matter under consideration, until after action by this House of Delegates has been taken upon this matter by the recommendation of the Reference Committee having it in charge Then you can come in and finish your part of this report Meanwhile we will consider that as pending, and since no motion is made it is still pending Go on

Dr. Louis H Bauer I will read the recommendation again about an amendment of the By-Laws

Speaker Kopetzky The amendment to the By-Laws need not be read twice We take official notice of the fact that an amendment to the By-Laws has been presented It shall be published according to the Constitution once during the year and will come up for action in the next House of Delegates Proceed, sir!

Dr. Louis H Bauer 'The supplementary report of the Treasurer states that the Workmen's Compensation Board has cost the Society a total the past year of $7,185 14 Workmen's Compensation administration has been of great benefit to the medical profession of this state Those registered by the County Societies including a certain number of non-members have been the direct beneficiaries The average cost of the State Board would be about fifty cents apiece for those registered under the Compensation law This is not much per person but it is a large sum for the State Society Your Committee feels that it would work no particular hardship on anyone if this cost were assessed against the County Societies in proportion to their registrants at the end of each year They in turn could absorb it or further pass the assessment on to their registrants as they deem advisable. The Committee feels that Workmen's Compensation should be paid for by those doctors who receive the benefits and that the Society should not pay for it out of its general funds This expense should be more or less stationary now that the work necessary in getting it organized and running smoothly is out of the way It is therefore recommended that the Council be authorized to take the necessary steps to levy this assessment as already outlined"

I move the adoption of the recommendation of the Reference Committee

The motion was seconded

Speaker Kopetzky It is moved by the Reference Committee that the Council be instructed to levy an assessment on those members of the State Society doing Workmen's Compensation practice under the law, and that fifty cents a head

Dr. Louis H Bauer Approximately fifty cents

Speaker Kopetzky And that the expense of approximately fifty cents a head be not levied on the general membership The Council will have to work out the details and put this matter into operation, provided it meets with the approval of this House What is your pleasure?

Dr. Arthur J Bedell, *Albany* I appreciate the work of the Reference Committee, but I object in principle to the doctrine that we should begin to segregate and assess for certain individual state-wide functions When you start the process it will be difficult to stop it I feel that this is a part of the function of the State Society, and as such I believe it should be under general budgetary control

I am perfectly familiar with most of the arguments that will be presented that all do not participate in it, but for years we have had a State Directory which upstate men have received all of them flattered to see their names in print but they practically except in rare instances have ever used it They have been assessed for that for years, assessed far more that this compensation per capita would be I believe it unwise to establish the principle of separate taxation

Dr. David J Kaliski Do I understand the Chairman of the Reference Committee to state that this sum is to be absorbed by the County Societies?

Chorus What is the question?

Speaker Kopetzky The question has been asked Is the gentleman from New York correct in his understanding that this sum that is to be assessed by the Council on those participating in Workmen's Compensation will be absorbed by the County Societies? The Chairman of the Reference Committee will please answer that question

total margin of $9,000 Although the income from dues has steadily increased, the expenditures have increased more, so that the margin has become smaller and smaller

A year ago in accepting this similar Reference Committee's report, the following recommendation was adopted by the House

"The House of Delegates direct that the Society maintain its expenditures within its ordinary income, exclusive of the principal or the income from its investments, and that this policy be not departed from except by resolution of the House either in regular or special meeting assembled or by reference vote."

There being no immediate prospect of the general economic situation being relieved nor there being any encouragement on the horizon that the threat of social upheaval is apt to diminish during the next few years, to cut into the general fund of the Society would soon leave it bankrupt There remains, therefore, the alternative of cutting expenses or raising the dues If expenses are to be cut, manifestly the cuts must come on those items which will affect the welfare of the profession the least

The Trustees have made definite recommendations about the JOURNAL and the Directory, but as these items have been referred to a special committee, this committee will make no comments or recommendations

One recommendation by the Trustees is that the Publicity and Publication departments be merged This refers to a combination of the present Public Relations Bureau with the JOURNAL Publication Department, the latter recommended by the Trustees No decision can or should be made on this until a definite decision has been reached about the JOURNAL In any event, the Committee deems it unwise to consider any consolidation until after a Publication Department has been established, provided such a step is taken If the Society decides to establish its own Publication Department, then your Committee believes that the Public Relations Bureau should be merged with the Publication Department as the two Departments could be run more economically as one and without impairment of the efficiency of either

The Board of Trustees also calls attention to the fact that they must approve all contracts and that approval without full information is meaningless They feel that if they are to approve a contract involving a large sum of money, they should participate in making the contract Certainly, if the Board of Trustees is to remain a valuable body it should have such authority This Board is thoroughly familiar with all the assets and liabilities of the Society and the financial interest of the Society in any contract will be furthered by the fact of such knowledge.

It is, therefore, recommended that the By-Laws be amended as follows

Section 2, Chapter V of the By-Laws is hereby amended by inserting the following before the final sentence of that section "The Board of Trustees shall make and execute all contracts for the Society"

Inasmuch as any amendment must wait a year before final action can be taken, no action is necessary now, but this is read in order to comply with Section 2, Chapter XVIII of the By-Laws

The Board of Trustees also specifically recommends that the dues not be raised Before considering this the Committee has two other recommendations to make, as follows

(1) The Supplementary Report of the Treasurer states that the Workmen's Compensation Board has cost the Society a total the past year of $7,185 14 Workmen's Compensation administration has been of great benefit to the medical profession of this state Those registered by the County Societies including a certain number of non-members have been the direct beneficiaries The average cost of the State Board would be about fifty cents apiece for those registered under the Compensation Law This is not much per person but it is a large sum for the State Society Your Committee feels that it would work no particular hardship on anyone if this cost were assessed against the County Societies in proportion to their registrants at the end of each year They in turn could absorb it or further pass the assessment on to their registrants as they deem advisable. The Committee feels that Workmen's Compensation should be paid for by those doctors who receive the benefits and that the Society should not pay for it out of its general funds This expense should be more or less stationary now that the work necessary in getting it organized and running smoothly is out of the way It is therefore recommended that the Council be authorized to take the necessary steps to levy this assessment as already outlined

(2) There was a final difference of $9,000 this year between the income from dues and the actual expenditures This added to the recommended saving of over $7,000 on Workmen's Compensation totals over $16,000 The Committee recommends that the Council endeavor to increase this still more by economies in the present budgetary items so that the budget will be at least $20,000 less than the estimated income from dues, leaving this amount for contingencies, emergencies, and protection of or addition to the capital It is recommended that this budgetary restriction be adopted.

The increasing inroads and attacks on the medical profession require corresponding increasing vigilance on our part The officers and committees of the Society are called upon to sacrifice both time and money in carrying on the affairs of the Society and the protection of the individual doctor The profession must lend its weight to the protection of its own welfare Can this be best accomplished by volunteers or individuals on a full-time salary? If the latter is the answer, then an increase in dues may be necessary

The Committee hopes that economies will be effected in the JOURNAL and in the publication of the Directory If so these economies plus the savings recommended on Workmen's Compensation and other budgetary restrictions may make any increase in dues unnecessary

We should first know the result of these steps in economy and also should know, that if any increase in dues is necessary, how the additional money is to be spent and what probable benefits would ensue.

State Society, and felt that something must be done in the way of retrenchment of expenditures unless we are to cut seriously into our permanent fund. Bear in mind that last year we lost $14,000 altogether in spite of the fact that $19,000 was added to the permanent fund. This was considered not as increasing expenditures If you will recall I read this statement 'This expense should be more or less stationary now that the work necessary in getting it organized and running smoothly is out of the way" We felt there should not be any gradual increase in this expense, and I think the Committee still feels it is an emergency measure to help us tide over this present financial upheaval we are in, without working a hardship on anyone.

The question was called for and the motion was put to a vote, and was lost

DR. LOUIS H BAUER 'There was a final difference of $9 000 this year between the income from dues and the actual expenditures This added to the recommended saving of over $7 000 on Workmen's Compensation totals over $16,000 (That will have to be deleted in view of your previous action) The Committee recommends that the Council endeavor to increase this still more by economies in the present budgetary items so that the budget will be at least $20,000 less than the estimated income from dues (on my own responsibility, Mr Speaker, without consulting with the Committee, I would amend that figure to $13 000, which is the $20,000 less the $7,000 which has been eliminated by the House) leaving this amount for contingencies, emergencies and protection of or addition to the capital It is recommended that this budgetary restriction be adopted."

I *so move.*

The motion was seconded

SPEAKER KOPETZKY The recommendation of the Reference Committee that a budgetary restriction of $13,000 be adopted, said $13 000 to be reserved for contingencies, emergencies, and protection of or addition to the capital as a sort of reserve fund, is before you for action. A motion has already been made and seconded to adopt the said recommendation. Is there any discussion? Are you ready for the question?

DR. JAMES F ROONEY As a member of the Board of Trustees I should like to know what provision is to be made in relation to this contingent fund. What is to be done with it? Is it to be invested? Is it to be placed in savings banks? What is the opinion of the House as to the manner in which this one more fund is to be managed? I should like to hear—and I am sure all of the other members of the Board of Trustees would too although I speak only for myself—the opinion of the House as to the manner in which the Trustees, whose duty it is to supervise the financial affairs of the Society, are to manage this so-called contingent fund

DR. LOUIS H BAUER May I answer that question? This is not a separate fund. The custom has been to budget the items from the income of the Society at so much, leaving a balance for leeway to cover emergencies and additions to capital. We are merely recommending that the budget be not more than $13,000 less than the estimated income from dues It is not a separate fund requiring a special accounting It would be available for emergencies or for additions to capital, the same as any budgetary restriction applies today This year there was an estimated saving of $4 500 between the budget and the actual estimated income from dues We are recommending that next year it be $13,000 less

SPEAKER KOPETZKY Is there any further discussion? Are you ready for the question?

DR. HARRY ARANOW, *Bronx* I would like to know why $13,000 less?

DR. LOUIS H BAUER The original recommendation of the Committee was for $20,000 The $7 000 that was the estimated savings on Workmen's Compensation has just been rejected so I simply deducted that, leaving it $13 000

DR. ARANOW It seems to me that would limit the Trustees too much and not give them the leeway they should have in administering our financial affairs To set a definite sum of $13 000 seems to me to be entirely unreasonable. I think, after all, the reason we have Trustees is to make the necessary decisions as to the financial affairs of our Society, and while the Society can express a sentiment it does not seem to me that they can act in this way without knowing definitely what the expenses are going to be.

SPEAKER KOPETZKY What do you want to do about it? Do you want to make any amendment?

DR. ARANOW I do not think the Trustees should be limited to any definite sum as a reserve. After all we have Trustees to make the decision on financial matters for us. They get *together, and decide what items of expense* are proper and what are not proper, in view of our estimated income. There are many emergencies which arise, and they should be able to act according to their best judgment.

DR. THOMAS P FARMER, *Onondaga* I wish to speak against this recommendation. I realize the weight that the Committee has given to it, and I think they are prompted by the highest ideals On the other hand, the setting aside of a special amount is rather a dangerous precedent

This year our expenses are actually increased by the traveling fund of the House of Delegates to the San Francisco Convention. We will not have to meet that again another year, but such a thing may come up again some time, and it may interfere with some other expenditure that the Society is carrying on for some excellent work. I would be very heartily in favor of supporting a recommendation showing the desire to set aside a larger amount but to specifically state the sum, I am opposed to that

DR JOHN J MASTERSON *Kings* I do not think that the Board of Trustees in view of the increasing activities of our Society and all the work that the members wish it to do should be asked to save $13 000 out of our budget. I think if they will live within the budget that is all we should ask them to do

There is something in there about an emergency We have been accumulating money for a

DR. LOUIS H BAUER The Reference Committee recommends that at the end of the year the cost of the Workmen's Compensation be assessed against the County Society registrants Therefore the County Society will, of course, have the option as to whether they will absorb it directly or further pass it on to those registered in the County

DR. KALISKI I wish to point out that at the present time the larger counties have found it necessary already to make an assessment, although it is a voluntary assessment, against the individuals who are registered and authorized under the Workmen's Compensation Law This is necessary because of the machinery that the County Societies have had to set up to carry out the various functions under the law It would, therefore, mean that there would be a double assessment on the members, particularly in the larger counties, where it is obligatory and absolutely necessary to have an additional source of revenue to take care of the work of the County Societies in regard to Workmen's Compensation Consequently there would be a County Society assessment, which amounts to at present $2 or $3 per registrant, plus the additional assessment which the Committee recommends

It seems to me there are certain functions that devolve upon the State Society in regard to Workmen's Compensation I do not think these functions should be assessed against a county Society or against the individual members in the County Society There are many intangibles connected with this new Workmen's Compensation Law I believe it is the obligation of the State Society to carry on this function in regard to Workmen's Compensation, not only as it affects the administration of the law, but also as it affects contact with the State, and with the Labor Department and various other agencies I think at this time at the very beginning when we are working out the details of the Workmen's Compensation Law that the cost should be borne by the State Society and not assessed against the individual County Societies I also agree with everything that Dr Bedell has said, and I am against this recommendation.

DR. JAMES F ROONEY, *Albany* I entirely agree with the two preceding speakers It is a very simple thing to levy a tax at a small sum and it is a very easy thing to increase that tax year by year until the child has become a giant

There is considerable complaint in that many of the members do not feel they are getting all they should from the Medical Society of the State of New York. If we were to assess them still further, it would intensify this complaint which largely is due to comparative lack of knowledge of what the State Society is doing for them.

There is one other factor that has not been spoken of, and that is this It would be very difficult, as I see it, for the administrative mechanism of this Society to exercise the rigid control over the financial expenditures of this Workmen's Compensation *Division* in the event that it was felt, through extension of its work, and the County Societies being obliged to pay a per capita assessment in proportion to the number of those who are registered in those Societies under the law, that they could increase it, say, $10, $20, or $30, so they would have to meet each year the additional expenditures that might be required from the extension of the Division's activities

I hope that the motion of the Reference Committee will not prevail I hope that the membership of this Society and of all of the County Societies will realize that this is distinctly a function of the State Society, for which they are already paying, and for which they should continue to pay out of their general funds

DR. CHAS GORDON HEYD, *New York* In connection with the recommendation of the Reference Committee, we should bear in mind the genesis of this whole problem. Governor Lehman appointed a Commission composed entirely of members of the Medical Society of the State of New York and the Academy of Medicine. The object of that Commission was to take Workmen's Compensation out of the realm of being a racket and make it a decent, dignified form of medical service. The Medical Society of the State of New York wrote all of the medical provisions of the revised or amended Workmen's Compensation Bill Therefore, they assumed a moral responsibility to organize medically the service under the amended Workmen's Compensation Bill

If the recommendation of the Reference Committee prevails, you are going to segregate essential functions of the Society, which means disruption, incomplete control, and diversification of financial responsibility

I think the recommendation of the Reference Committee should be disapproved by the House of Delegates

SPEAKER KOPETZKY Is there any further discussion?

DR. WALTER P ANDERTON, *New York* It is only fair to state on the other side of the question that there are plenty of men who are not practicing Workmen's Compensation, and who are helping to pay for it, while the other men who do practice it are getting the benefits It strikes me the people who are getting the benefits should pay for them rather than those who are not.

DR. JOSEPH WRANA, *Queens* I would like to call attention to the fact that only one registration is required by law, that the law *does not require* a registration fee, and that the Medical Society of the State of New York cannot enforce the payment of such a fee, also that non-members will not pay a fee.

SPEAKER KOPETZKY If there is no further discussion, the Chairman of the Reference Committee will now close the debate.

DR. LOUIS H BAUER, *Nassau* I may say that the Reference Committee considered all of the arguments that have been brought forth here. We realize it is an unusual step to take. We feel, however, that Workmen's Compensation does not apply to every man in the State Society, and that it is not really establishing a precedent in segregating the expense for this and passing on certain factors which applied to the local Societies.

The Committee was greatly impressed with the seriousness of the financial situation of the

particular conflict between the original motion and the substitute motion as amended If this House wishes to limit the budget to an amount which will leave $13,000 as a margin from our receipts for dues, it may also instruct us to definitely earmark four or six per cent of the total receipts for a specific purpose, that is to make up the loss on our investment funds

I think, without having had a chance to consult with the rest of the Board, that the Trustees would very much like to have you adopt the original motion for this reason Every year the budget is made out, and then all through the year at every meeting we are presented with demands for extra funds which were not provided for in the budget. Some of those sums are quite large. We feel that if we are definitely limited in the amount that we are allowed to allocate the Committees will be a little bit more careful, and some of the officers may be a little more careful about incurring debts, and then coming to us and saying, "What are you going to do about it? We have spent $400 or $500 If you don't pay it, we will have to pay it out of our own pockets" It kind of puts us on the spot, and we would like very much to have this House instruct us to limit that budget so that we may have a $13,000 leeway, not necessarily to be saved and put into the investment fund, but as Dr Goodrich says if an emergency comes up we will have that money to fall back on. We know there will be emergencies all through the year In addition to that, I see no reason why we should not be instructed to definitely earmark a certain percentage—four or six per cent—for the specific purpose of investment As a Trustee, I see no objection to an accommodation of these two motions, and I hope you will vote in favor of the Reference Committee's recommendation.

SPEAKER KOPETZKY The question is on the amendment reserving six per cent of the gross net income until the losses have been made up, and then it is at the disposition of future houses or future recommendation of the Board of Trustees That is the substitute motion which you have decided to consider It is before you for action. There being no further discussion, I will call for the question Those in favor of adopting the amendment will kindly say "Aye", those opposed, "No" The Chair is in doubt. Those in favor of the amendment will kindly raise their right hands, those opposed to it will kindly raise their right hands The amendment is carried. It disposes of the original recommendation of the Reference Committee since you decided to consider the substitute motion and have adopted it as amended

DR. WILLIAM KLEIN, *Bronx* I don't think it disposes of the original motion. This is a separate motion entirely The original motion has nothing to do with putting away for this or for that.

SPEAKER KOPETZKY The original motion said to put away $13,000 It was substituted that four per cent be put away rather than the $13,000 That was amended to make the four per cent, six per cent, and the amendment was accepted by the proposer, and as such was passed, that is, the substitute motion, as amended, was passed. Is there anything else in the original motion that needs action?

PRESIDENT GOODRICH A point of order!

SPEAKER KOPETZKY I am willing to entertain your point of order and be corrected, if I am wrong

PRESIDENT GOODRICH The substitute motion was to encourage the Board of Trustees and the Council to save an adequate amount each year for a contingent fund which if not used during the year by appropriation of the Trustees for emergencies should be saved for the capital account. Dr Heyd recommended that four per cent be earmarked to cover the depreciation on securities, and Dr Kosmak, the Treasurer, moved that four per cent be made six per cent. In other words, there were two amendments Now, as I understand it, Mr Speaker, the vote disposed of the six per cent amendment. It did not dispose of the substitute motion which I made.

SPEAKER KOPETZKY I think the point of order is well taken.

PRESIDENT GOODRICH My substitute motion was to give the Trustees a free hand. I felt it was honoring them to give them a free hand because of our confidence in their wisdom and their care of our funds Inasmuch as the Chairman of the Board of Trustees says they would be glad to have a specified amount set, I will withdraw my substitute motion.

DR. J RICHARD KEVIN, *Kings* I submit, sir, that this can be cleared up to everybody's satisfaction. I move you, sir, that the original motion as substituted be presented to the House now

SPEAKER KOPETZKY The original motion, as substituted, will you state it?

DR. LOUIS H BAUER "The Committee recommends that the Council endeavor to increase this still more by economies in the present budgetary items so that the budget will be at least $13,000 less than the estimated income from dues, leaving this amount for contingencies, emergencies, and protection of or addition to the capital"

PRESIDENT GOODRICH I second the motion of Dr Kevin.

SPEAKER KOPETZKY You have just heard the recommendation made by Dr Kevin that the original motion as amended be presented to the House. It has been seconded by the President. What is your pleasure?

DR. ARTHUR J BEDELL Question of information What happens to the motion that has just prevailed?

SPEAKER KOPETZKY It is law as far as this House of Delegates is concerned until it is rescinded or revoked

DR. JAMES F ROONEY Question of information Do I understand the ruling of the speaker to be that the only instruction thus far received from the House is that the Board of Trustees be instructed to set aside the matter of six per cent of the gross income of the Society for the purpose of creating a contingent fund to make up the losses in the investment portfolio of this Society through the fall of the market?

SPEAKER KOPETZKY That is as far as they go on the question.

DR. JAMES F ROONEY Then do I understand

good many years, and at the present time we have in our treasury over $200,000 which could be used, or at least part of it, in the event of any emergency arising, and I do not believe that the Board of Trustees should be restricted in the amount of our income that they should expend.

PRESIDENT GOODRICH I know from intimate experience in the three years in which I have sat on the Board of Trustees that you can trust the Board of Trustees to save all the money that it is possible to save by conscientious review of the recommendations as regards appropriations

My impression is that it would have the possibilities of great danger if any specific amount, large or small, should bind the Trustees to a certain amount in a contingent fund for emergencies or for the investment of capital That has been going on in a satisfactory amount for several years, as you know, for you have just heard what the accumulations amount to, although we have had to take losses due to a drop in the bond market. However, I do believe that this House should encourage the Council and Trustees in every way possible to so guard appropriations that a large contingent fund can be set aside each year, and so that they will lay aside something for investment as well when that contingent fund is not all used for emergencies

I believe the spirit of this recommendation is grand but, gentlemen, you have very carefully and thoughtfully elected the Board of Trustees, and in my opinion it is obligatory upon the House that, having elected them for a certain purpose, they let them fulfill that purpose and be our economists, be our thoughtful last consideration for the saving of our monies

I would, therefore, move you, sir, a substitute motion that the Council and the Board of Trustees be encouraged to set aside each year an adequate contingent fund for emergencies, and that when the year is completed any unused portion of any contingent fund so set aside should be placed in the investment account.

The substitute motion was seconded.

DR. CHAS GORDON HEYD I would like to move an amendment to Dr Goodrich's substitute motion. Encouraging Trustees to save money is a pious hope They must be instructed to save it. The amendment is that it be obligatory upon the Trustees to deduct four per cent of the gross annual income of the Medical Society of the State of New York to be placed in a contingent fund until such time as our deficit on investments of $52,545 is equalized. We are $52,000 poorer in our investment account—

Discussion to the amendment

SPEAKER KOPETZKY I must know from the House whether it wants to entertain the substitute motion or the original motion. Then we will discuss Are you ready for question that we shall discuss the substitute? Those in favor kindly say "Aye", opposed, "No" Those in favor of a discussion, not an adoption but a discussion, of the substitute motion, kindly rise, those opposed, kindly rise. The substitute motion is before you for discussion Dr Heyd will open the discussion.

DR. CHAS GORDON HEYD You can see, gentlemen, we have had to write off on our investment account a bond item to the extent of $27,539 We also have a drop in the market value of our investments of $25,006, so we are according to the market value of our holdings today $52,000 poorer than we were some time ago

Good business and prudence will suggest that we set aside a certain sum of money over a period of years to wipe out that loss If the market value comes up, then we have saved that money, if the market value remains the same, in the course of the next seven or eight years we will have liquidated the fall in our investment account

I, therefore, propose the amendment that out of the total monies received by the Society there be set aside each year four per cent until such time as a sum of money shall have been accumulated to equal the deficit in our bond and investment account.

PRESIDENT GOODRICH A question of information May I ask Dr Heyd if he accepts the principle enunciated in the substitute motion that this amount is a contingent fund which should be laid aside for emergencies during the year and then the unused portion added at the end of the year to this purpose for which he decides four per cent should be set aside? If so, I would be very glad to accept his amendment, and the whole question could be opened along that line.

SPEAKER KOPETZKY The amendment specifically states in its language what it does that it lays aside four per cent until the loss is made up It does not say that anything should be specifically done with it, nor does it imply any principle. It is very specific.

PRESIDENT GOODRICH May I ask is that besides the motion for the contingent fund?

SPEAKER KOPETZKY The amendment says nothing about a contingent fund The amendment says four per cent of the gross income shall be reserved until such time as the losses are made good, and then it shall go into the general fund, and there is nothing implied or reserved in the matter It is a purely business proposition. As stated, the amendment is before the House, and it amends President Goodrich's substitute motion. The discussion is on the amendment

PRESIDENT GOODRICH Is this added to the motion, or is it a substitute for the substitute motion?

SPEAKER KOPETZKY It is an amendment of the substitute motion, and it is before the House for discussion

DR. GEORGE W KOSMAK I would like to amend Dr Heyd's amendment to make that figure six per cent, and not four per cent.

The amendment was seconded

SPEAKER KOPETZKY You are filling in blanks The amendment to the amendment is that instead of four per cent it shall be six per cent.

DR. HEYD I will accept the six per cent has been accepted by the good business man

SPEAKER KOPETZKY Six per cent has been

PRESIDENT GOODRICH I will accept the amendment and make it a part of my substitute motion

DR. GEORGE W COTTIS I do not see any

tions, but the whole matter is becoming more and more complex from your discussion, and for one I will hardly know what to do when it is over

SPEAKER KOPETZKY Is there any further discussion?

DR. WALTER A. LUDLUM, *Kings* As I understood this last motion, the sum of $13,000 is directed to be put into a contingent fund, which is in addition to the six per cent which must be set aside to take care of the depreciation in our investment account. I wonder whether all of the delegates understand that that is the case, that on the basis of a $155,000 income, approximately fifteen per cent is removed from the budget, leaving at the disposition of the Trustees in the budget only eighty-five per cent of the dues income. I think that is an improper procedure, but my essential purpose is to make it clear that it is not six per cent, nor $13,000, but that it is six per cent plus $13,000 that is recommended for specific disposition.

DR. ARTHUR J BEDELL, *Albany* Question of information Have we not in this House disposed of this six per cent segregation? Did we not vote to do that?

SPEAKER KOPETZKY We did

DR. BEDELL It is disposed of?

SPEAKER KOPETZKY Yes, sir Now you are voting on the additional—

DR. BEDELL Question of information I would like a restatement of just what we are voting on please

SPEAKER KOPETZKY Dr Heyd, read your motion leaving off that portion which we have already adopted

DR. HEYD The annual dues of the Society are approximately $155,000 My substitute motion was to enable the subtraction of $13,000 from that $155,000 Deducting that $13,000 would then make available for budgetary purposes a residue of $142,000 It is then up to the Trustees to run this Society on a budget of $142,000

What will we do with the $13,000? We will take six per cent of $155,000, approximately $9,000, and we will place that at the discretion of the Board of Trustees for reinvestment to bring our loss of our investment fund up to the purchase price. The remainder, $4,000, is utilized in the discretion of the Board of Trustees for any emergency or contingency that might arise. The purpose of my substitute motion was to enable the saving of $13,000, of which $9,000—or six per cent of our total membership revenue—would be set aside to liquidate the loss in our investment fund and to bring it up to its cost price It is not incompatible with the motion that has been passed

SPEAKER KOPETZKY Are you satisfied, Dr Bedell?

DR. BEDELL No, sir, I don't see how that does it. If I understood Dr Heyd, he was using this six per cent from the gross That was the motion that prevailed?

SPEAKER KOPETZKY It did.

DR. BEDELL Then why do we have to reconsider it now?

SPEAKER KOPETZKY It is not under reconsideration.

DR. BEDELL I did not consider I was voting for a six per cent to be used as an increase of our investment fund, to be taken from this other $13,000 I thought we disposed of the six per cent. If so, why is it now before us?

SPEAKER KOPETZKY The Chair understood that six per cent of the gross income was to be deducted and used by the Trustees to refund losses The question of the $13,000 came originally from the Reference Committee, and had no connection with refunding losses That was subsequently changed by Dr Heyd's motion to set aside a definite sum to be used by the Trustees at their discretion, reducing the total amount of income available for ordinary budgetary purposes, and giving a reserve, a leeway, a margin, in addition to the six per cent. Your conception, as you stated it, Dr Bedell, was my conception, but we both might be wrong

DR JAMES F ROONEY This thing seems to be making confusion more profound I think it can be settled by a motion to reconsider the previous vote in relation to this substitute motion

SPEAKER KOPETZKY Did you vote in favor of it?

DR. ROONEY Yes, I voted in favor of it. I move it be reconsidered

SPEAKER KOPETZKY It must be seconded by someone who voted in favor of it also

Several said they voted in favor of it, and were seconding Dr Rooney's motion

SPEAKER KOPETZKY The question is on the reconsideration of the six per cent amendment that was passed Are you ready for the question? All in favor, kindly say aye, those opposed, no It is a vote, and the question is now on the reconsideration of the amendment setting aside six per cent of the budget for the refunding of losses What is your pleasure?

DR. JAMES F ROONEY A point of order

DR. THOMAS P FARMER A point of order

DR. ROONEY I yield to Dr Farmer

DR. FARMER How can you vote an amendment to a motion that has been withdrawn?

SPEAKER KOPETZKY You cannot. That is why I said the motion could not be withdrawn

DR. ROONEY I raise this point of order In view of the fact that we are now ready to reconsider an amendment or a substitute to the original motion, is it not the Speaker's understanding that that reopens the whole question of the original motion?

SPEAKER KOPETZKY It is my understanding that the whole question should be reopened, although technically it does not do so, and with the consent of the House, since we want to do business, let us open the whole question, and start anew

DR. ROONEY I would yield the floor to Dr Chas Gordon Heyd in order that he may present his motion

DR. HEYD Mr Speaker, I think we are all agreed that we want to save money, therefore, I make a motion—it is a substitute—

SPEAKER KOPETZKY There is nothing before the House at all

DR. HEYD I make the following motion In order to instruct the Board of Trustees as to the desirability of placing our fiscal management on a proper basis that an amount not to

that Dr Kevin's motion is really a re-making of the motion made by the Chairman of the Reference Committee?

SPEAKER KOPETZKY Yes, sir It is really a restatement of the motion made by the President allowing the Board of Trustees freedom of action in setting aside additional monies to cover contingencies or conserve our funds

DR. JAMES F ROONEY I am not speaking for the Board of Trustees, I am speaking for myself as a Trustee I want some specific direction from this House as to where we are going to keep the expenses of this Society We have had enough of this sort of thing that we can do this or that. We are highly honored by the confidence that the House places in us but nevertheless, as Dr Cottis has so well said, at every meeting there come up extra budgetary appropriations for extra budgetary expenditures, expenditures that are against the resolutions of this House passed during the last five years If the House wishes to instruct this Board specifically that you shall hold out of the normal dues income of this Society $13,000 a year, keep the budget, the total budgetary appropriations below that sum, limit all of these—I hesitate to use the word, but it is true—illegal expenditures, I am sure that as a trustee I should welcome it, and I think I can bespeak that same sentiment for nearly all the other members, if not all the members, of the Board.

I hope that this motion to instruct us to limit the total expenditures to $13,000 below our normal dues income will prevail

PRESIDENT GOODRICH Question of privilege.

SPEAKER KOPETZKY State your question of privilege

PRESIDENT GOODRICH As I understand Dr Kevin's motion, it referred to the report of the Reference Committee, am I right, that $13,000 be set aside for a contingent fund?

DR. KEVIN Yes My interpretation of this sir, according to my knowledge of parliamentary law is that whatever precedes an amended motion, when that amended motion is carried, you must necessarily carry through step by step Therefore, the last amendment to be voted on now, and the first one made, is the money question The amendments made after that have been passed.

PRESIDENT GOODRICH Therefore, I seconded Dr Kevin's motion feeling that he had essentially, according to parliamentary law, moved the previous question, which was the report of the Reference Committee I withdrew my motion, therefore, my substitute motion, and was told by the Speaker I could not because it had been amended

SPEAKER KOPETZKY Because the substitute motion as amended had been carried.

PRESIDENT GOODRICH I was attempting to show my change of feeling when the Trustees desired the specific instructions by seconding the motion of Dr Kevin. I wish the House to understand that what Dr Kevin has really done is in effect to move the previous question and in order to clear the skies I seconded it. I have no desire to press the substitute motion as long as the members of the Board of Trustees prefer the specific instruction

DR CHAS GORDON HEYD I propose a substitute motion, and that is that the House of Delegates communicate to the Board of Trustees their instructions that an amount equal to $13,000 be obligatorily subtracted from the annual dues for the purpose of meeting the contingencies that may arise in the administration of the Society, second, that an amount equal to six per cent of the annual dues shall be allocated to liquidate the disparity between our investment cost and the market value.

SPEAKER KOPETZKY The second part of your motion has been passed. The other part is before you

Dr Heyd's substitute motion was seconded

DR. GEORGE W KOSMAK It would seem to me an unnecessary restriction on the Board of Trustees to state a definite amount which is to be subtracted from the yearly income. Although we have an income of $155,800 approximately from dues, those dues are not promptly paid, and at the end of the year we may not obtain the dues of that entire membership I believe that it would be a very unsatisfactory bookkeeping procedure if the Trustees were compelled to subtract a definite sum such as $13,000 If a percentage figure were agreed upon on the dues actually collected, that would be a much more appropriate thing, but I do not believe that is necessary It seems to me that the sentiment of this House of Delegates and of a great many other members of the Society must have impressed itself upon the Board of Trustees sufficiently by this time so that they will use their natural saving functions to make that budget just as small as possible. I, for one, cannot see the need or necessity of naming an abstract sum to be deducted from a more or less variable income. I hope that part of the motion will not prevail

DR WILLIAM H ROSS As one of the Trustees I wish to observe that if this complexity goes on very much longer, it will require some definite interpretation of the results to guide the Trustees I think you are getting into deep water

This year there have been various items presented since the budget was adopted, amounting to about $6,000 Some of it is very definite and we must meet it. To definitely set aside a contingent fund is an invitation to spend it. I think that you ought to trust the Board of Trustees to take care of the funds, and I can assure you that in their present state of mind they are inclined not to exceed the income of the Society at all

The particular thing that you have before you is an effort to make up the losses due to market depreciation I question whether that is very sound or not We have an income still from the investments, and if that is not touched that will make up that difference It amounts this year to about $10,000, so we will gradually come out of it, and of course everybody expects some day there will be some improvement and withdrawal of the wet blanket that holds business paralyzed today, and then there will be an appreciation I question very much whether it is a wise thing to limit the Trustees in that way However, we are ready to accept instruc-

exceed $13,000 be deducted from the gross income of the Society per year, of that $13,000, $7,000 shall be allocated under the direction of the Board of Trustees yearly until such time as the loss in our investment fund is made up to the market price that we paid for our securities

The motion was seconded

DR ARTHUR J BEDELL There is one word in Dr Heyd's motion that changes it from what he said originally, as I heard it He said "up to the sum of $13 000 "

DR. HEYD "Not to exceed $13,000 "

DR. BEDELL Not to exceed it, but under that, they could allocate $100, or $200, in other words, there is a maximum, but no low limit.

DR. HEYD I will change the diction An amount of $13,000, but not in excess of it.

SPEAKER KOPETZKY Is there any further discussion?

DR HARRY ARANOW, *Bronx* I am afraid I am guilty for having this thing all tangled up, but I cannot see the point of making a definite limit Suppose by some unforeseen good luck the Board of Trustees are able to save $25,000, what are they going to do with the rest of the money? Aren't they allowed to save that money? It seems to me it ought to be not less than $13,000 If they can save more money, that much the better

DR. JOHN J MASTERSON, *Kings* Did Dr Heyd say what the Board of Trustees were going to do with the difference between the $7,000 and $13,000, the $6,000? I do not recall that he stated just what the Board of Trustees were going to do with that.

SPEAKER KOPETZKY Can you enlighten the gentleman from Kings?

DR HEYD In substance, we are going to tell the Board of Trustees they have to save money, that they have got to save an amount equal to $13,000 per year, and the only way we can do it is to have them deduct that out of the total income of the Society before they make their budget. That has been done for years, gentlemen, with previous treasurers Of that $13,000, $7,000 is to go to make up the difference between the present market value of our securities and what we paid for them, which leaves $6,000 for contingencies that may arise.

After that $13,000 is deducted from our total income, if we do business for a year, and the Board of Trustees at the end of the year has a surplus, it does not limit their saving that too, but it impresses upon them it is the wish of this House that they shall at least take out of current revenue $13,000

DR. THOMAS H CUNNINGHAM It seems to me that we are building up a very involved machinery here to do a very simple thing that we all want to do We want to economize. We do not have to impress upon the Board of Trustees the fact that this Society should save money We do not have to set up a contingent fund, because who is going to say when that fund shall be spent. If we would go at this thing from the other end, if we would cut down the expenditures of our Society, the perfectly unnecessary, useless, silly expenditures that are going on, and have been going on, over a period of years, they would not have the slightest difficulty in laying aside $13,000 every year That I think is the way to go at this

SPEAKER KOPETZKY The question has been called for Those in favor of the question, kindly say "Aye", those opposed, "No" The question is before you Those in favor of adopting the motion made by Dr Heyd, kindly say "Aye", those opposed, "No" It is a vote, and it is carried, and it is so ordered.

DR. LOUIS H BAUER One more item, Mr Speaker "We should first know the result of these steps in Economy and also should know, that if any increase in dues is necessary, how the additional money is to be spent and what probable benefits would ensue.

"The Committee, therefore, feels it would not be advisable to raise the dues at this time, and except for the proposed assessment for Workmen's Compensation (which you have already voted out), recommends that no increase be made."

I move the adoption of that recommendation

The motion was seconded.

DR. JAMES R. REULING, JR., *Queens* I would move that that matter be laid on the table until after the report of the Reference Committee on President's Address has been made.

The motion was seconded, put to a vote, and was carried.

DR. LOUIS H BAUER There are two items that have been deferred, so the adoption of the report as a whole cannot be made at this time.

SPEAKER KOPETZKY I agree with you.

32 Report of Committee on Prize Essays

I have here a notification that I must put before the House. "The Committee on Prize Essays reports receipt and consideration of two essays submitted for the Lucien Howe Prize for which competition is open this year The Committee has awarded the prize to that essay bearing the sign 'Macula'" That is signed by Frank Bethel Cross, Chairman of the Committee on Prize Essays

Secretary Irving opened the envelope.

SPEAKER KOPETZKY The winner of this prize I am very proud to announce is one who has won prizes here before Dr Arthur J Bedell, of Albany Congratulations, sir! (Applause)

"We believe," Dr Ewing said, "that radiation therapy is still in its infancy The equipment for radiation therapy (x-rays and radium) includes all known modern instruments and some new super-voltage x-ray apparatus not previously employed"

Together with its second largest radium pack in the world, this new super-voltage x-ray equipment will constitute the most powerful anti-cancer artillery to be concentrated anywhere in the world

"This building," Dr Ewing said, "is an indication of a new era in the attitude toward cancer We wish to rob cancer of the pall of emotion which obscures its real significance and intensifies its stern realities and prevents real progress We want to introduce the idea of a business approach to the cancer problem, an emergency business, with the best service given to the early comers

"This is only a beginning We expect in time this whole city block (between First and York Avenue and Sixty-seventh and Sixty-eighth Streets) will be covered by other additions to our plant.

"I think modern society has got to realize that if it wants the results which it is more or less emphatically demanding and hysterically providing for in some directions, it will have to devote a much larger portion of its material resources to projects of this type, and I do not believe the modern conscience is up to that point yet."

The ceremonies were held on the anniversary of the laying of the cornerstone of the original Memorial Hospital fifty-four years ago

Newsy Notes

LIABILITIES OF $1,546,240 and assets of $596,096 are listed in bankruptcy schedules filed by the Broad Street Hospital in New York City

•

RICHMOND MEMORIAL HOSPITAL, Dreyfus Foundation, Staten Island, celebrates "Hospital Day" every year by planting a tree in memory of some person prominently connected with the institution

This year the hospital honored the late Richard Getz of Eltingville, secretary of the hospital's maintenance organization until his death January 19

Getz is the twelfth person in whose name a tree has been planted along the driveway surrounding the hospital on Princes Bay road

DR LEWIS WEBB CRIGLER, surgeon director and secretary of the board of surgeons of the Manhattan Eye and Ear Hospital, died suddenly on April 30 of a heart attack in his office. He was sixty-one. He was a consulting surgeon at the New Rochelle Hospital, the Sutton Memorial Hospital, in Middletown, the United Hospital, in Port Chester, and the Peekskill Hospital

•

MISS NORA E YOUNG, who has served twenty years as superintendent of the Caledonian Hospital in Brooklyn, was honored at a dinner at the Towers on April 23

Improvements

PETITIONS URGING THE city council of Schenectady to authorize immediate construction of an addition to the City hospital to alleviate overcrowding in the contagious wards and provide facilities for mental disease cases were presented to the city council on May 13

THE NIAGARA COUNTY BOARD of Supervisors is considering the feasibility of the enlargement of the present hospital building at the Niagara County Infirmary at Lockport or the erection of a new building

THE MEMORIAL HOSPITAL at Niagara Falls has installed new kitchen equipment at a cost of some $10,000

At the Helm

THESE HOSPITAL OFFICIALS HAVE BEEN CHOSEN

Dr A J Rongy to be president of the medical advisory board of the Hospital for Joint Diseases in New York City

Francis L Durk, to be president of the Brooklyn Eye and Ear Hospital

Dr Joseph Tenopyr, to be director of surgery at the Kings County Hospital

Dr Israel Magelaner, to be medical superintendent of Harlem Hospital

Mrs Otho C Hudson, to be president of the Hempstead branch of the Nassau Hospital auxiliary

Hospital News

A New "Cancer Center of the World"

THE CORNERSTONE OF "the largest cancer center in the world," the new Memorial *Hospital for the Treatment of Cancer and* Allied Diseases in New York City, was laid on May 20 in the presence of a distinguished gathering of medical men and cancer authorities

The principal speaker was Dr James Ewing, director of the hospital and president of its medical board, one of the world's foremost authorities on cancer Another speaker was Dr Lewis W Douglas, former director of the United States Budget, now principal and vice-chancellor of McGill University, Montreal, who is a member of the Memorial board of managers Harry Robbins, president of the hospital, presided

The new institution was described by Dr Ewing as "the largest cancer center in the world," and by Mr *Robbins as "the greatest* cancer project now contemplated anywhere in the world" With its ultramodern equipment, the most powerful anticancer artillery in the world, combined with its research laboratories, its highly trained personnel and its vast experience from the treatment of 75,000 cancer patients in the hospital's fifty-four years of existence, the new institution, under the leadership of Dr Ewing, will embody humanity's greatest hope for finding a cure for cancer, if such a cure, or cures can be found

"To the public, rich and poor, patient or philanthropist," Dr Ewing said, "this conspicuous building, added to an already great medical center (the Cornell University Medical College), should offer renewed encouragement to approach the cancer problem with greater alertness, wider knowledge and finer discrimination, for by fighting cancer with such weapons we may eventually reach substantial control of this group of diseases

"New York City need no longer acknowledge a subordinate position among the great cities of the world in equipment to accomplish these ends"

The new "cancer center of the world" occupies a plot 613 by 200 feet given by John D Rockefeller, Jr, and is being constructed with a grant of $3,000,000 made by the General Education Board of the Rockefeller Foundation The institution, a twelve-story and penthouse building costing nearly $4,000,000, will replace the present institution at Central Park West and 106 Street

Labor Rows Caused Delay

It became known that labor troubles caused a delay of one year in the completion of the building and an additional cost of about $1,000,000 in its construction It was added that "many luxuries and conveniences and some necessities desired for the patients" had to be omitted from the building as a result of these labor difficulties, which, it was charged, developed as a result of "extravagant demands and tyrannical practices" of certain labor unions connected with the building trades

As the original grant was only $3,000,000, it was learned, the extra $1,000,000 still must be raised In addition, the center will need about $2,000,000 as an endowment to operate the new institution at full capacity, and to enable it to carry on the most concentrated and effective methods for fighting mankind's natural enemy No 2 yet to be contemplated anywhere in the world

A box was placed in the cornerstone containing publications of the hospital, data on the present five-year cure-rates at the institution in the different types of cancer, external and internal, gold seeds filled with the radium product radon, used in treating cancer, and other radium applicators developed at the Memorial Hospital, photographs of the nursing, laboratory, clinical, fellowship and resident staffs and other articles and documents

The building, fronting on East Sixty-eighth Street, will provide at the outset for 168 beds, with provision for expansion It will contain extensive facilities for diagnostic and treatment clinics, surgery, research laboratories and special provision for irradiation with x-rays and radium

light district, and, if so, what would it show? Are we merely guppies of a later type, to follow where they lead?

Well, it turned out that they were very moral little guppies, and shunned the red lights A few wayward ones resorted thither, but the great majority, 75 to 1, we are informed, preferred the blue Just what position was taken by the 5 guppy is not stated, perhaps he merely lingered longingly near the crimson chamber, and scored only half a point He was a waverer Some of us are like that.

Ask the Ants What they Think

Thus the guppies Next the ants Volumes, as we all know, have been written to tell us what smart little fellows the ants are. As man has the supreme intelligence in the animal kingdom, so the ant seems to have the keenest brain in the insect realm What could be happier than to signal from one realm to the other and ask, as it were, "Which do you like better, red or blue?" The query was put to the ants by enclosing them in an ant-house, covered, half and half, with red and blue cellophane. Which will they prefer? The reply is immediate and emphatic They flocked at once to their red-light district, without a qualm If the ants are as brainy as claimed, does this contain any teaching for us? To make their feeling perfectly clear, they not only lived and bred in the crimson or primrose paths, but used the blue part for a cemetery, and buried their dead there "That's all your land of blue-laws is good for," they seemed to say The moral is for each one to decide for himself, perhaps with the self-searching inquiry—"Are you an ant or a guppy?"

Then it was the turn of the flies to be questioned, and they were introduced into a box, lighted half red, half blue. Determined to show their independence, they treated both colors alike, and favored neither the blue nor the red.

The Answer to the Riddle

What is the explanation of these contradictory tastes of guppies, ants, and flies? Dr Vollmer, (who, by the way, must not be blamed for the deep moralizing above on his experiments) explains it very simply Guppies like the light, so they prefer the blue, because it is lighter than the red, ants like semi-darkness, and favor the red, flies seek full daylight, so that neither red nor blue satisfies them

Rats are of course favorite subjects of study, and the European investigators had based some of their conclusions about the influence of light upon experiments with them, so Dr Vollmer conducted a series of careful tests upon these rodents, running over many months There is not room here to go into the details, but it is sufficient to say that any differences that appeared in the animals living under one or another color of light were easily explained on other grounds, so that there was no true scientific evidence that the colored light was of any effect at all

"Negative Light Therapy"

It is true that smallpox patients kept in "red room" do not develop suppuration of th eruptions and subsequent scar formation, but, as Dr Vollmer remarks, this is "negative light therapy," and depends on the exclusion of chemically active light, the light of short wave length, and not on any specific influence of red light. Total darkness is equally good He also attacks the treatment of inflamed areas with red light irradiation as an "erroneous theory," and reports a number of experiments of which "all presented negative results" Favorable results of red light treatments obtained by various clinicians and practitioners he would explain as due in great part to the heat that goes with the light.

This is a growing subject. Heat, light, sound, x-ray, and perhaps cosmic ray, are all forms of radiation, all a part of the mysterious realm of radioactivity Its potency for good or ill no one denies Radiotherapy is in its infancy One of the European workers quoted by Dr Vollmer is Professor Pincussen, whose very name suggests that the subject is full of good points

---

The witty young wife of a university professor remarked during her first pregnancy, "I'm quite modern, you know—heir-conditioned, so to speak."—*Canadian Doctor*

Nurse "I think he's regaining consciousness, doctor, he just tried to blow the foam off his medicine."—*Petroleum Engineer*

Across the Desk

Pink Panes for Pained People?

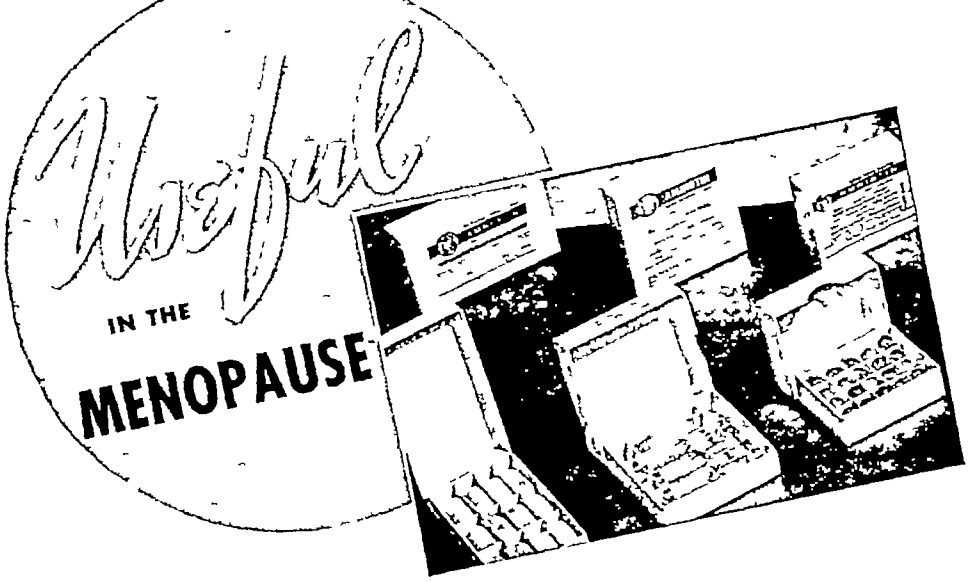
THE MAN WHO SEES THE WORLD through rose-colored spectacles is happy, while the one who "sees red" is unhappy, the one "in the red" feels blue, and the one "in the pink" feels like a fighting-cock The cure for the blue fellow in the red would have been the "long green" in the days when that currency was current So we must own up that color-therapy at least has something in it There is evidently something in it for the "healers," who put their sufferers, or victims, under colored glass, of all hues and shades of the rainbow The rainbow is thus the Bow of Promise to the victim, and the healer is after the pot of gold at the end of it. The various shades give the shady touch that is appropriate

Busy doctors, too occupied with real medicine to pay attention to fakirs, will be amazed to know that there is actually a cult of "chromotherapy" Some of its "literature" has fallen into the hands of the Editor of the *Archives of Physical Therapy*, who says that "every ethical member of the medical profession would be shocked were he to see the brazen and fantastic claims made for it by self-appointed exponents of this twilight zone of therapy" Its followers, it appears, are promised a veritable gold mine in the utilization of colored pieces of glass to treat all human ills Some of the colors listed are picturesque, anyway—"flame red," "spinach green," "etheric blue," "tangerine," "love-bird green," "pansy," "cobalt green," etc

Every Ill Has its Hue

All that's necessary, it seems, is to put panes of the right color in the window, and the sick man is as good as cured. When this form of treatment comes into its own, we shall see the doctor hastening down the street, not with his little black bag, but with an assortment of colored window-panes under his arm, and carrying a blob of putty and a silver-handled putty-knife A lightning diagnosis indicates tomato-worm green, say, and in no time the sufferer is basking in this pleasing hue.

"I feel better already, doc," he says



"Yes, you are very, very lucky," replies the chromotherapist grandly "You called me just in time. By tomorrow you would have had to have potato-bug brown, much more expensive Now this will cost you only fifty dollars" But the patient has fainted

As the literature explains, some colors are "anabolic," some "metabolic," and some "katabolic" Some are caustic, some gentle, while others can cause "festers" or slay germs Certain colors, it appears, are helpful in enabling a tottering dotard to regain sexual potency, while others, on the contrary, will subdue excessive erectility Even a child harboring worms in its intestinal canal merely needs certain colored pieces of glass placed over its abdomen "to cause the worms to be so humiliated at the unworthy treatment that they will emigrate in a huff," as the Editor of *Physical Therapy* remarks, or else, he adds, "it may be that the worms, in spite of 'spinach-green,' feel they cannot compete with Popeye, the sailor man"

Turn the Searchlight on it

Now, we may ask, is there a serious side to all this? Do various colors of light really have any healing value? Is there a grain of the true wheat in all this chaff of charlatanry? Well, a paper marked by science and good sense on this very topic was read in April at the Eastern Sectional Meeting of the American Congress of Physical Therapy, and is printed in its *Archives* It is written by Dr Hermann Vollmer, a Heidelberg man now practicing in New York City, who carried out his experiments at Mount Sinai Hospital

What Dr Vollmer did was to take the claims made by German and other investigators whose findings were published in scientific journals, and test them out carefully with his colleagues at Mount Sinai One test, for example, was made with the little fish known as guppies A rectangular aquarium was divided into two equal parts, but in such a way that the guppies could swim freely back and forth from one to the other One half was covered with red cellophane, the other with blue. Which would the fish prefer? Would they flock to their red-

IT IS GENERALLY RECOGNIZED that the subjective nervous symptoms which frequently accompany the menopause can quite generally be alleviated by treatment with estrogenic substance (Amniotin) The problem of dosage of estrogenic substance is practically the only one confronting the physician who seeks to treat or correct the vasomotor symptoms Amniotin is supplied in dosage forms and potencies adaptable to any circumstances

Many cases can be controlled by several Amniotin capsules by mouth (3000 to 6000 units) daily More severe cases may require the hypodermic injection of 10,000 or 20,000 units daily Dosage should be adjusted until relief is effected

Amniotin is highly purified and is the Squibb preparation of the estrus-inducing hormone It is available for hypodermic use in ampuls containing 2000, 10,000, and 20,000 International Units and in the form of Pessaries and Capsules containing 1000 and 2000 International Units Amniotin has also been widely and successfully used in treating gonorrheal vaginitis in children

ALSO AVAILABLE

Follutein—Pregnancy urine extract for treatment of menorrhagia, and of undescended testes and male hypogenitalism, packages of 500, 1000, and 5000 units

Anterior Pituitary Extract—Contains growth, thyrotropic, and gonadotropic factors, supplied in 20-cc vials containing 200 growth units

REVIEWED

Physiology for Pharmaceutical Students By Harold H Barber, B Sc. Octavo of 477 pages, illustrated Baltimore, William Wood and Company, 1937 Cloth, $4 50

For the purpose for which this book was written it fulfills its need. It is an excellent text of elementary physiology but hardly of the type to interest the practioner or student of medicine

GEORGE B RAY

Security Against Sickness. A Study of Health Insurance. By I S Falk. Octavo of 423 pages Garden City Doubleday, Doran & Company, Inc. 1936 Cloth, $4 00

The author of this valuable book has spent years on and had wide experience in his subject The work is divided into four parts

I Need for group payment of sickness in the United States

II A study of European experience with health insurance

III The basis of an American program

IV Appendices

It is a scholarly performance in succinct, clear style, with much convincing logic. The author's conclusions are based on an enormous amount of "laboratory work," covering statistical data from England, Germany, and Denmark Aside from the cold facts of his work, Dr Falk reveals an unbiased mind, acute vision and a profound sense of duty toward the "underdog" in life, which add immensely to the challenge he brings to American thinkers on a problem which has been looming larger He emphasizes the disastrous effect of incapacitating sickness amongst our people on the stability of the land His reasoning leads him to the conclusion that, sooner or later, compulsory health insurance will become an established fact with us, and that, properly inducted, it should be absolutely free from political influence, should protect the needy in times of sickness and as (in England) be of great benefit to the profession of medicine and dentistry in an ethical solution of their economic problems Right or wrong, the book is a masterpiece and will command serious attention of a large number of people, both lay and professional, whose hearts are in this big subject and who will surely read with open minds what the author has to suggest in the way of "basic principles for an American program" He is perfectly clear that some form of State medicine is inevitably in the offing, and he is giving to those interested the findings of years of intensive study and wise counsel, based upon these findings and his own conception of the indications to be followed.

Dr Falk's book both merits and demands careful reading by everyone interested in the alleviation of human suffering and particularly in relation of the dual function of the medical profession and the State.

HIGH
CLASS
PRIVATE
SANITARIUM

recognized for 50 years by the medical profession

Restricted to a limited number of nervous and mental cases—not violent, dangerous, noisy, or otherwise objectionable—with special facilities for the care of aged and chronic cases

Environment and administration are such as affords the most beneficial atmosphere Contact with others is controlled through caring for the patients in suites (practically all with private baths) A fully qualified medical and nursing staff, physiotherapy hydrotherapy, massage, and occupational therapy in addition to attractive and modern buildings make "Falkirk in the Ramapos" one of America's most complete sanitaria

Convenience and accessibility in nearby accommodations and transportation for guests makes the location ideal The sanitarium and its program of treatment are so arranged that patients have greater comfort and service than found elsewhere

•

KARO EQUIVALENTS

1 oz vol	40 grams 120 cals.
1 oz wt	28 grams 90 cals
1 teaspoon	15 cals.
1 tablespoon	60 cals

Normal children frequently complain of fatigue Careful study reveals that they do not consume enough food to provide them with necessary energy requirements, half of which are derived from carbohydrate

The energy supply should be in the form which is easily digested, not readily fermented and which does not affect the appetite for other foods Karo meets all these requirements.

Infant feeding practice is primarily the concern of the physician, therefore, Karo for infant feeding is advertised to the Medical Profession exclusively

The Summer-Time Use of Mead's Oleum Percomorphum

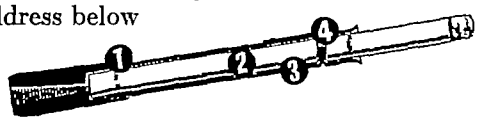
During the hot weather, when fat tolerance is lowest, many physicians have found it a successful practice to transfer cod liver oil patients to Mead's Oleum Percomorphum.

Due to its negligible oil content and its small dosage, this product does not upset the digestion, *so that even the most squeamish patient can* "stomach" it without protest

There are at least two facts that strongly indicate the reasonableness of the above suggestion (1) In prematures, to whom cod liver oil cannot be given in sufficient dosage without serious digestive upset, Mead's Oleum Percomorphum is the antirricketic agent of choice. (2) In Florida, Arizona and New Mexico, where an unusually high percentage of sunshine prevails at all seasons, Mead's Oleum Percomorphum continues increasingly in demand, as physicians realize that sunshine alone does not always prevent or cure rickets

Mead Johnson & Company, Evansville, Indiana, invite you to send for samples of Mead's Oleum Percomorphum for clinical use during the summer months to replace cod liver oil—*Adv*

Zeus MAY HELP YOU...WITH PATIENTS STUBBORN ABOUT SMOKING

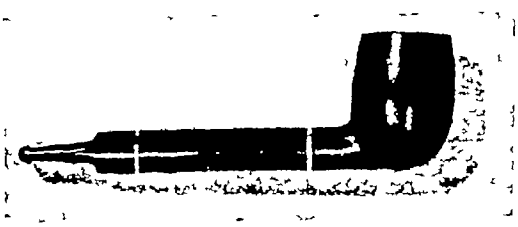


Many Physicians Have Had Marked Success with this Filter-holder Which Eliminates More Than 70% of Nicotine and Tar Products from Tobacco Smoke

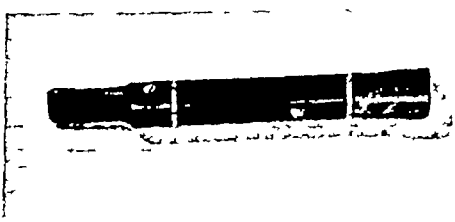
THE ADVICE to "cut down smoking" is often most difficult to follow, even with good intentions of the patient

The use of the Zeus Filter-holder permits a 70% reduction in the intake of nicotine and tar products without the user's mental resistance or physical distress (More than a million men and women now use Zeus for smoking pleasure alone)

Many physicians have observed its value in cases of respiratory irritation and other toxic manifestation due to nicotine



Full details about Zeus, and the tests conducted by leading scientific institutes, will be gladly mailed you Please write to the address below



Only Zeus is backed by three years' official laboratory tests Its high efficiency is due to these exclusive features (1) A perfectly sealed bit no unfiltered smoke passes through, (2) a tube scientifically designed for expansion of filter cigarette in absorbing nicotine and tar products from 30-40 cigarettes, (3) special type aluminum tube condenses vapors in smoke as nothing else can, (4) ejector expels stubs

NOW—PIPES AND CIGAR HOLDERS WITH THE FAMOUS Zeus PRINCIPLE!

● For pipe smokers special Zeus Pipes, several popular styles, with a cigarette as filter, make possible elimination of up to 80% nicotine The Zeus Cigar Holder, of much the same appearance and using the same principle as the cigarette holder, eliminates 70% nicotine and tar products The Zeus Corporation, 745 Fifth Avenue, New York

A Call for Nurses

A shortage of stewardesses on American Airlines with the increasing of summer schedules was announced by Victor Vernon, personnel director for American Airlines, Inc.

With one class of eight new stewardesses graduated recently and being placed in immediate service, the situation was somewhat relieved, but a new class is now being formed and applications accepted for another class after that, according to Mr Vernon

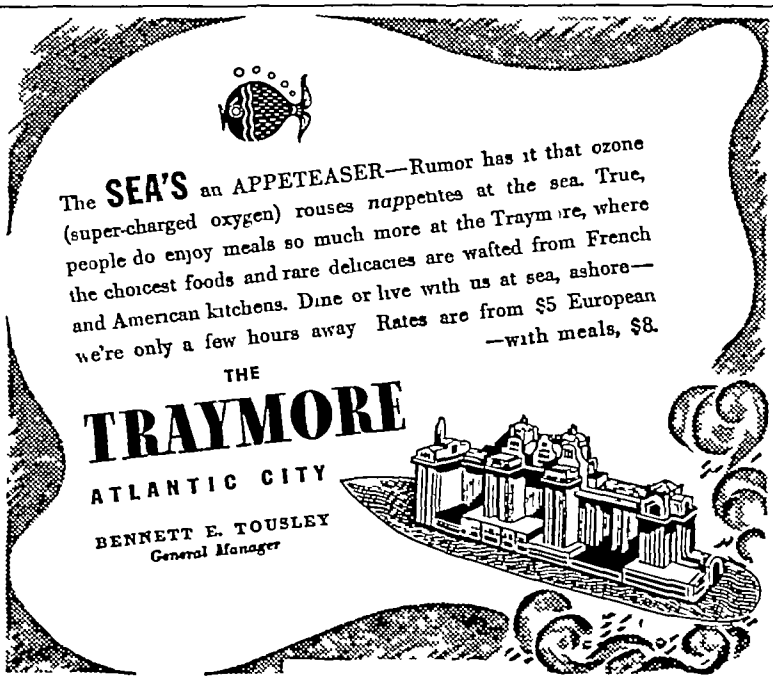
Qualifications for the position of stewardess are she must be a registered nurse, under five feet five inches in height, weigh less than 120 pounds and have a pleasing personality

If their application is accepted, they will be given transportation to Chicago for a five weeks' training course at the American Airlines Stewardess training school, after which they will be placed in active service at some point on American's coast-to-coast system

* * *

Unchanged Through Ages

Half an hour from the Chateau Frontenac, Quebec, diagonally across the St Lawrence and readily accessible by ferryboat and bridge, lies the sleepy little Ile d'Orleans This island, the population of which resides in about six small parishes, is totally devoid of advertising billboards, hotdog stands and other modern eyesores, and remains much as it was when Cartier first named it Isle of Bacchus, because of the profusion of wild grapes he found there, centuries ago Its sturdy habitant people still bake their bread in outdoor ovens, plough their fields with oxen and weave their own cloth on hand looms much as their grand-parents did, and they are so busily engaged in wresting a living from the soil that they have no time for newfangled methods or notions



Each little parish, the largest of which is Ste Petronille, where the ferry docks, has its immaculate, tall-spired church, and wayside shrines beckon to the faithful at many points between the villages Orleans is probably the least-visited and at the same time the best place for the stranger at Quebec to meet the habitant and observe his primitive mode of living, and a 30-mile drive around the highway which encircles the island will more than repay the visitor having the initiative to make it.

Aviation Progress

Launching a field study program to supplement classroom work, thirty-six Flying Cadets from the Morgan Park Military Academy in Chicago, left the Chicago Municipal Airport on Sunday, May 22nd, for a 3,000 miles aerial tour of the historical and geographical spots of interest in the United States

Under the command of Major Edward Bouma and accompanied by Dwight Green, former United States District Attorney in Chicago, the cadets took off in two giant "Flagship" Clubplanes of American Airlines, Inc., for Pittsburgh, the first stop, for a reception by city officials From there the flight continued to Harrisburg where the cadets met Gov George H Earle who accompanied them on a tour of the historic Gettysburg battlefields

From there the flight continued to Washington where the cadets were guests of Attorney-General Homer S Cummings and paid a visit to President Roosevelt. While here, a side trip was made to Virginia to visit the historical spots of that section

The flight then carried the cadets to New York for a day of sightseeing Returning home, the flight was made via Buffalo and Detroit.

Facts and data gathered by the students on this trip, according to Major Bouma, are to be used by the cadets to summarize and round out their classwork for the year

* * *

Bobby came in at noon looking very distressed.

"Mummy," he said, "is it true that an apple a day keeps the doctor away?"

"Yes, dear," replied his mother "Why?"

"Well, I've kept thirteen doctors away this morning, but I'm afraid one will have to come this afternoon."

* * *

"Willie, how dare you kick your little brother in the stomach!"

"It's his own fault—he turned round!"

* * *

"What has become of the portable garage?"

"I tied a dog to it, and a cat passed by"

"First of all, my boy, realize that my time is limited Secondly, say what you want. Thirdly, be short."

"Well, dad, first I do Secondly I will Thirdly I am!"

Great Western

AMERICAN WINES

When a patient requires a superior champagne during convalescence specify "Great Western."

Produced since 1860 in the Finger Lakes region of New York, from grapes grown under soil and climatic conditions matching those of the great wine-producing regions of France, Great Western wines have been well recognized by the medical profession

All Great Western Champagnes are made by the old French method of secondary fermentation in the bottle They thus possess the optimum carbon dioxide content Yet Great Western sells at a most reasonable price

GREAT WESTERN WINES

Vermouth Dry and Sweet

Champagnes Dry, Medium and Sweet The American champagne that won medals in Paris, Brussels and Vienna

Still wines (under 14% alcohol) Sauterne, Rhine, Claret, still Burgundy

Still wines (18% alcohol) Sherry, Port Tokay, Sweet Catawba, Muscatel

IN ADVISING PATIENTS ON SMOKING

WITH the many and varied claims made for cigarettes, *you* can be of assistance to your patients. With your scientific knowledge, you can discriminate between mere claims and basic facts.

Due to the use of diethylene glycol as the hygroscopic agent, Philip Morris have been proved* less irritating than other cigarettes. . proved so conclusively that the medical profession recognizes the substantial nature of this improvement in cigarette manufacture.

Test Philip Morris on patients suffering from congestion of the nose and throat due to smoking. Verify for yourself Philip Morris superiority.

PHILIP MORRIS & CO.
